(OMIM Ref. No. 603184) and cyclin C are components of the RNA polymerase II holoenzyme complex, where they function as a protein kinase that phosphorylates the C-terminal domain of the largest subunit of RNA polymerase II. The CDK8/cyclin C protein complex is also found in a number of mammalian 'Mediator'-like protein complexes, which repress activated transcription independently of the C-terminal domain in vitro. Akoulitchev et al. (2000) demonstrated that CDK8/cyclin C can regulate transcription by targeting the CDK7 (OMIM Ref. No. 601955)/cyclin H (OMIM Ref. No. 601953) subunits of the general transcription initiation factor IIH (OMIM Ref. No. 189972). CDK8 phosphorylates mammalian cyclin H at serine 5 and serine 304 both in vitro and in vivo, in the vicinity of its functionally unique N- and C-terminal alpha-helical domains. This phosphorylation represses both the ability of TFIIH to activate transcription and its C-terminal kinase activity. In addition, mimicking CDK8 phosphorylation of cyclin H in vivo has a dominant-negative effect on cell growth. Akoulitchev et al. (2000) concluded that their results linked the Mediator complex and the basal transcription machinery by a regulatory pathway involving 2 cyclin-dependent kinases. This pathway appears to be

unique to higher organisms.

[6388] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6389] Lew, D. J.; Dulic, V.; Reed, S. I. : Isolation of three novel human cyclins by rescue of G1 cyclin (Cln) function in yeast. Cell 66: 1197–1206, 1991. ; and

[6390] Akoulitchev, S.; Chuikov, S.; Reinberg, D. : TFIID is negatively regulated by cdk8-containing mediator complexes. Nature 407: 102–106, 2000.

[6391] Further studies establishing the function and utilities of CCNC are found in John Hopkins OMIM database record ID 123838, and in cited publications numbered 105 and 1054–1055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_006800) is another VGAM212 host target gene. MSL3L1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MSL3L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MSL3L1 BINDING SITE, designated SEQ

ID:1331, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6392] Another function of VGAM212 is therefore inhibition of Male-specific Lethal 3-like 1 (Drosophila) (MSL3L1, Accession NM_006800). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MSL3L1. Thrombospondin 1 (THBS1, Accession NM_003246) is another VGAM212 host target gene. THBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by THBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of THBS1 BINDING SITE, designated SEQ ID:1004, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6393] Another function of VGAM212 is therefore inhibition of Thrombospondin 1 (THBS1, Accession NM_003246), a gene which is a member of a family of adhesive molecules, involves in blood clotting and in angiogenesis. Accordingly, utilities of VGAM212 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with THBS1. The function of THBS1 has been established by previous studies. Natural inhibitors of angiogenesis are able to block pathologic neovascularization without harming the preexisting vasculature. Volpert et al. (2002) demonstrated that 2 such inhibitors, thrombospondin I and pigment epithelium-derived factor (OMIM Ref. No. 172860), derive specificity for remodeling vessels from their dependence on Fas/Fas ligand (134637; 134638)-mediated apoptosis to block angiogenesis. Both inhibitors upregulated FasL on endothelial cells. Expression of the essential partner of FasL, Fas receptor, was low on quiescent endothelial cells and vessels but greatly enhanced by inducers of angiogenesis, thereby specifically sensitizing the stimulated cells to apoptosis by inhibitor-generated FasL. The antiangiogenic activity of thrombospondin I and pigment epithelium-derived factor both in vitro and in vivo was dependent on this dual induction of Fas and FasL and the resulting apoptosis. Volpert et al. (2002) concluded that this example of cooperation between pro- and antiangiogenic factors in the inhibition of angiogenesis provides one explanation for the ability of inhibitors to select remodeling capillaries for destruction.

Animal model experiments lend further support to the function of THBS1. To explore the function of thrombospondin I in vivo, Lawler et al. (1998) disrupted the Thbs1 gene by homologous recombination in the mouse genome. Platelets from these mice were completely deficient in Thbs1 protein; however, thrombin-induced platelet aggregation was not diminished. The deficient mice displayed a mild and variable lordotic curvature of the spine that was apparent from birth. They also displayed an increase in the number of circulating white blood cells, with monocytes and eosinophils having the largest percent increases. Although other major organs showed no abnormalities consistent with high levels of expression of Thbs1 in lung, Lawler et al. (1998) observed abnormalities in the lungs of the mice lacking Thbs1. Extensive acute and organizing pneumonia with neutrophils and macrophages developed by 4 weeks of age. The macrophages stained for hemosiderin, indicating that diffuse alveolar hemorrhage was occurring. Later, the number of neutrophils decreased and a striking increase in the number of hemosiderin-containing macrophages was observed associated with multiple-lineage epithelial hyperplasia and the deposition of collagen and elastin. The re-

sults indicated that THBS1 is involved in normal lung homeostasis.

[6394] It is appreciated that the abovementioned animal model for THBS1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6395] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6396] Lawler, J.; Sunday, M.; Thibert, V.; Duquette, M.; George, E. L.; Rayburn, H.; Hynes, R. O. : Thrombospondin-1 is required for normal murine pulmonary homeostasis and its absence causes pneumonia. J. Clin. Invest. 101: 982-992, 1998. ; and

[6397] Volpert, O. V.; Zaichuk, T.; Zhou, W.; Reiher, F.; Ferguson, T. A.; Stuart, P. M.; Amin, M.; Bouck, N. P. : Inducer-stimulated Fas targets activated endothelium for destruction by anti-a.

[6398] Further studies establishing the function and utilities of THBS1 are found in John Hopkins OMIM database record ID 188060, and in cited publications numbered 2392-2398, 7 and 2399 listed in the bibliography section hereinbelow, which are also hereby incorporated by refer-

ence. Cysteine and Glycine-rich Protein 3 (cardiac LIM protein) (CSRP3, Accession NM_003476) is another VGAM212 host target gene. CSRP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSRP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP3 BINDING SITE, designated SEQ ID:1031, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6399] Another function of VGAM212 is therefore inhibition of Cysteine and Glycine-rich Protein 3 (cardiac LIM protein) (CSRP3, Accession NM_003476). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP3. FLJ11181 (Accession NM_018350) is another VGAM212 host target gene. FLJ11181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11181 BINDING SITE,

designated SEQ ID:1817, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6400] Another function of VGAM212 is therefore inhibition of FLJ11181 (Accession NM_018350). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11181. FLJ23132 (Accession XM_171194) is another VGAM212 host target gene. FLJ23132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23132 BINDING SITE, designated SEQ ID:3692, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6401] Another function of VGAM212 is therefore inhibition of FLJ23132 (Accession XM_171194). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23132. GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612) is another VGAM212 host target gene. GAB3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB3 BINDING SITE, designated SEQ ID:2378, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6402] Another function of VGAM212 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. MGC13033 (Accession NM_031447) is another VGAM212 host target gene. MGC13033 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13033, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13033 BINDING SITE, designated SEQ ID:2198, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6403] Another function of VGAM212 is therefore inhibition of MGC13033 (Accession NM_031447). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13033. PRO0386 (Accession NM_018562) is another VGAM212 host target gene. PRO0386 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0386, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0386 BINDING SITE, designated SEQ ID:1844, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6404] Another function of VGAM212 is therefore inhibition of PRO0386 (Accession NM_018562). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0386. LOC149351 (Accession XM_086503) is another VGAM212 host target gene. LOC149351 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149351, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149351 BINDING SITE, designated SEQ ID:3132, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6405] Another function of VGAM212 is therefore inhibition of LOC149351 (Accession XM_086503). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149351. LOC163590 (Accession NM_145034) is another VGAM212 host target gene. LOC163590 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC163590, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163590 BINDING SITE, designated SEQ ID:2512, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6406] Another function of VGAM212 is therefore inhibition of LOC163590 (Accession NM_145034). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC163590. LOC256307 (Accession XM_173118) is another VGAM212 host target gene. LOC256307 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256307, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256307 BINDING SITE, designated SEQ ID:3726, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6407] Another function of VGAM212 is therefore inhibition of LOC256307 (Accession XM_173118). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256307. LOC87769 (Accession XM_049058) is another VGAM212 host target gene. LOC87769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC87769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC87769 BINDING SITE, designated SEQ ID:2912, to the nucleotide sequence of VGAM212 RNA, herein designated

VGAM RNA, also designated SEQ ID:547.

[6408] Another function of VGAM212 is therefore inhibition of LOC87769 (Accession XM_049058). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC87769. LOC89890 (Accession XM_026976) is another VGAM212 host target gene. LOC89890 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89890 BINDING SITE, designated SEQ ID:2574, to the nucleotide sequence of VGAM212 RNA, herein designated VGAM RNA, also designated SEQ ID:547.

[6409] Another function of VGAM212 is therefore inhibition of LOC89890 (Accession XM_026976). Accordingly, utilities of VGAM212 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89890. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 213 (VGAM213) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6410] VGAM213 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM213 was detected is described hereinabove with reference to Figs. 1–8.

[6411] VGAM213 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6412] VGAM213 gene encodes a VGAM213 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM213 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM213 precursor RNA is designated SEQ ID:199, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:199 is located at position 112175 relative to the genome of Vaccinia Virus.

[6413] VGAM213 precursor RNA folds onto itself, forming

VGAM213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6414] An enzyme complex designated DICER COMPLEX, `dices` the VGAM213 folded precursor RNA into VGAM213 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM213 RNA is designated SEQ ID:548, and is provided hereinbelow with reference to the sequence listing part.

[6415] VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM213 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6416] VGAM213 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM213 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM213 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6417] The complementary binding of VGAM213 RNA, herein designated VGAM RNA, to host target binding sites on VGAM213 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM213 host target RNA into VGAM213 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6418] It is appreciated that VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM213 host target genes. The mRNA of each one of this plurality of VGAM213 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM213 RNA, herein designated VGAM RNA, and which when bound by VGAM213 RNA causes inhibition of translation of respective one or more VGAM213 host target proteins.

[6419] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM213 gene, herein designated VGAM GENE, on one or more VGAM213 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6420] It is yet further appreciated that a function of VGAM213 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM213 correlate with, and may be deduced from, the identity of the host target genes which VGAM213 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[6421] Nucleotide sequences of the VGAM213 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM213 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM213 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM213 are further described hereinbelow with reference to Table 1.

[6422] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM213 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM213 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6423] As mentioned hereinabove with reference to Fig. 1, a function of VGAM213 gene, herein designated VGAM is inhibition of expression of VGAM213 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM213 correlate with, and may be deduced from, the identity of the target genes which VGAM213 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[6424] Growth Differentiation Factor 8 (GDF8, Accession NM_005259) is a VGAM213 host target gene. GDF8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GDF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF8 BINDING SITE, designated SEQ ID:1196, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:548.

[6425] A function of VGAM213 is therefore inhibition of Growth Differentiation Factor 8 (GDF8, Accession NM_005259), a gene which acts specifically as a negative regulator of skeletal muscle growth. Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF8. The function of GDF8 has been established by previous studies. The transforming growth factor-beta superfamily encompasses a large number of growth and differentiation factors that play important roles in regulating embryonic development and in maintaining tissue homeostasis in adult animals. GDF8, or myostatin, is a member of this super-

family with a role in the control and maintenance of skeletal muscle mass. Animal model experiments lend further support to the function of GDF8. To determine the biologic function of Gdf8, McPherron et al. (1997) disrupted the Gdf8 gene by gene targeting in mice. Gdf8-null animals were significantly larger than wildtype animals and showed a large and widespread increase in skeletal muscle mass. Individual muscles of mutant animals weighed 2 to 3 times more than those of wildtype animals, and the increase in mass appeared to result from a combination of muscle cell hyperplasia and hypertrophy. McPherron et al. (1997) suggested that Gdf8 functions specifically as a negative regulator of skeletal muscle growth. Lin et al. (2002) observed increased skeletal muscle mass in their myostatin-null mouse model compared to wildtype animals as early as 4 weeks of age. In addition, the mutant mice showed reduced production and secretion of leptin (OMIM Ref. No. 164160) which was associated with reduced fat deposition. The reduced adipogenesis in the knockout mice suggested that myostatin is involved in regulating adiposity as well as muscularity.

[6426] It is appreciated that the abovementioned animal model for GDF8 is acknowledged by those skilled in the art as a

scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[6427] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6428] Gonzalez–Cadavid, N. F.; Taylor, W. E.; Yarasheski, K.; Sinha–Hikim, I.; Ma, K.; Ezzat, S.; Shen, R.; Lalani, R.; Asa, S.; Mamita, M.; Nair, G.; Arver, S.; Bhasin, S. : Organization of the human myostatin gene and expression in healthy men and HIV–infected men with muscle wasting. Proc. Nat. Acad. Sci. 95: 14938–14943, 1998. ; and

[6429] Lin, J.; Arnold, H. B.; Della–Fera, M. A.; Azain, M. J.; Hartzell, D. L.; Baile, C. A. : Myostatin knockout in mice increases myogenesis and decreases adipogenesis. Biochem. Biophys. Res.

[6430] Further studies establishing the function and utilities of GDF8 are found in John Hopkins OMIM database record ID 601788, and in sited publications numbered 313–316, 2002–2003, 94 and 2050–1341 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regenerating Islet–derived–like, Pancreatic Stone Protein–like, Pancreatic Tread Protein–like (rat) (REGL, Accession NM_006508) is another VGAM213 host

target gene. REGL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by REGL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of REGL BINDING SITE, designated SEQ ID:1306, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:548.

[6431] Another function of VGAM213 is therefore inhibition of Regenerating Islet-derived-like, Pancreatic Stone Protein-like, Pancreatic Thread Protein-like (rat) (REGL, Accession NM_006508), a gene which is a member of REG family with unknown function. Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REGL. The function of REGL has been established by previous studies. The REG1A (OMIM Ref. No. 167770) and REG1B genes belong to the type I subclass of the REG family of genes, each of which encodes a 166-amino acid protein. Moriizumi et al. (1994) and Gharib et al. (1993) mapped the REG1A and REG1B genes to 2p12. Miyashita et al. (1995) demonstrated that 4 REG family genes are tandemly ordered in a 95-kb DNA region of 2p12. From analysis of YAC clones

containing the 4 genes using 2-color fluorescence in situ hybridization, they demonstrated the following order: 2cen--PAP--RS--REG1A--REG1B--ptel. (RS, so designated for REG-related sequence, shows a high degree of homology to the REG1 genes but has an in-frame stop codon in the protein coding region.)

[6432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6433] Miyashita, H.; Nakagawara, K.; Mori, M.; Narushima, Y.; Noguchi, N.; Moriizumi, S.; Takasawa, S.; Yonekura, H.; Takeuchi, T.; Okamoto, H. : Human REG family genes are tandemly ordered in a 95-kilobase region of chromosome 2p12. FEBS Lett. 377: 429-433, 1995. ; and

[6434] Moriizumi, S.; Watanabe, T.; Unno, M.; Nakagawara, K.; Suzuki, Y.; Miyashita, H.; Yonekura, H.; Okamoto, H. : Isolation, structural determination and expression of a novel reg gene, hum.

[6435] Further studies establishing the function and utilities of REGL are found in John Hopkins OMIM database record ID 167771, and in cited publications numbered 2513-2515 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.DKFZP434J214

(Accession XM_027639) is another VGAM213 host target gene. DKFZP434J214 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434J214, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434J214 BINDING SITE, designated SEQ ID:2586, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:548.

[6436] Another function of VGAM213 is therefore inhibition of DKFZP434J214 (Accession XM_027639). Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434J214. KIAA0440 (Accession NM_015556) is another VGAM213 host target gene. KIAA0440 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0440, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0440 BINDING SITE, designated SEQ ID:1636, to the nucleotide sequence of VGAM213 RNA, herein designated

VGAM RNA, also designated SEQ ID:548.

[6437] Another function of VGAM213 is therefore inhibition of KIAA0440 (Accession NM_015556). Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0440. LOC152756 (Accession XM_098262) is another VGAM213 host target gene. LOC152756 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152756 BINDING SITE, designated SEQ ID:3363, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:548.

[6438] Another function of VGAM213 is therefore inhibition of LOC152756 (Accession XM_098262). Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152756. LOC158428 (Accession XM_047249) is another VGAM213 host target gene. LOC158428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158428, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158428 BINDING SITE, designated SEQ ID:2889, to the nucleotide sequence of VGAM213 RNA, herein designated VGAM RNA, also designated SEQ ID:548.

[6439] Another function of VGAM213 is therefore inhibition of LOC158428 (Accession XM_047249). Accordingly, utilities of VGAM213 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158428. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 214 (VGAM214) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6440] VGAM214 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM214 was detected is described hereinabove with reference to Figs. 1–8.

[6441] VGAM214 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6442] VGAM214 gene encodes a VGAM214 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM214 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM214 precursor RNA is designated SEQ ID:200, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:200 is located at position 114150 relative to the genome of Vaccinia Virus.

[6443] VGAM214 precursor RNA folds onto itself, forming VGAM214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6444] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM214 folded precursor RNA into VGAM214 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM214 RNA is designated SEQ ID:549, and is provided hereinbelow with reference to the sequence listing part.

[6445] VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM214 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6446] VGAM214 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM214 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM214 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6447] The complementary binding of VGAM214 RNA, herein designated VGAM RNA, to host target binding sites on VGAM214 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM214 host target RNA into VGAM214 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6448] It is appreciated that VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM214 host target genes. The mRNA of each one of this plurality of VGAM214 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM214 RNA, herein designated VGAM RNA, and which when bound by VGAM214 RNA causes inhibition of translation of respective one or more VGAM214 host target proteins.

[6449] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM214 gene, herein designated VGAM GENE, on one or more VGAM214 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6450] It is yet further appreciated that a function of VGAM214 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM214 correlate with, and may be deduced from, the identity of the host target genes which VGAM214 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6451] Nucleotide sequences of the VGAM214 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM214 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM214 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM214 are further described hereinbelow with reference to Table 1.

[6452] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM214 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM214 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6453] As mentioned hereinabove with reference to Fig. 1, a function of VGAM214 gene, herein designated VGAM is inhibition of expression of VGAM214 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM214 correlate with, and may be deduced from, the identity of the target genes which VGAM214 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6454] Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762) is a VGAM214 host target gene. BHLHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB3 BINDING SITE, designated SEQ

ID:2162, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6455] A function of VGAM214 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762), a gene which represses both basal and activated transcription. Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB3. The function of BHLHB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127.Coagulation Factor IX (plasma thromboplastic component, Christmas disease, hemophilia B) (F9, Accession NM_000133) is another VGAM214 host target gene. F9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by F9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of F9 BINDING SITE, designated SEQ ID:709, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6456] Another function of VGAM214 is therefore inhibition of Coagulation Factor IX (plasma thromboplastic component, Christmas disease, hemophilia B) (F9, Accession NM_000133). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with F9. FLJ31737 (Accession NM_144984) is another VGAM214 host target gene. FLJ31737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31737 BINDING SITE, designated SEQ ID:2504, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6457] Another function of VGAM214 is therefore inhibition of FLJ31737 (Accession NM_144984). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31737. KIAA1505 (Accession XM_168469) is another VGAM214 host target gene. KIAA1505 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by KIAA1505, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1505 BINDING SITE, designated SEQ ID:3638, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6458] Another function of VGAM214 is therefore inhibition of KIAA1505 (Accession XM_168469). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1505. PHRET1 (Accession NM_021200) is another VGAM214 host target gene. PHRET1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHRET1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHRET1 BINDING SITE, designated SEQ ID:1947, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6459] Another function of VGAM214 is therefore inhibition of PHRET1 (Accession NM_021200). Accordingly, utilities of

VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHRET1. RYD5 (Accession XM_085737) is another VGAM214 host target gene. RYD5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RYD5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RYD5 BINDING SITE, designated SEQ ID:3103, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6460] Another function of VGAM214 is therefore inhibition of RYD5 (Accession XM_085737). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RYD5. LOC221337 (Accession XM_166387) is another VGAM214 host target gene. LOC221337 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221337 BINDING

SITE, designated SEQ ID:3556, to the nucleotide sequence of VGAM214 RNA, herein designated VGAM RNA, also designated SEQ ID:549.

[6461] Another function of VGAM214 is therefore inhibition of LOC221337 (Accession XM_166387). Accordingly, utilities of VGAM214 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 215 (VGAM215) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6462] VGAM215 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM215 was detected is described hereinabove with reference to Figs. 1–8.

[6463] VGAM215 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6464] VGAM215 gene encodes a VGAM215 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM215 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM215 precursor RNA is designated SEQ ID:201, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:201 is located at position 113419 relative to the genome of Vaccinia Virus.

[6465] VGAM215 precursor RNA folds onto itself, forming VGAM215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6466] An enzyme complex designated DICER COMPLEX, `dices` the VGAM215 folded precursor RNA into VGAM215 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM215 RNA is designated SEQ ID:550, and is provided hereinbelow with reference to the sequence listing part.

[6467] VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM215 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6468] VGAM215 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM215 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM215 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6469] The complementary binding of VGAM215 RNA, herein designated VGAM RNA, to host target binding sites on VGAM215 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM215 host target RNA into VGAM215 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6470] It is appreciated that VGAM215 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM215 host target genes. The mRNA of each one of this plurality of VGAM215 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM215 RNA, herein designated VGAM RNA, and which when bound by VGAM215 RNA causes inhibition of translation of respective one or more VGAM215 host target proteins.

[6471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM215 gene, herein designated VGAM GENE, on one or more VGAM215 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[6472] It is yet further appreciated that a function of VGAM215 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM215 correlate with, and may be deduced from, the identity of the host target genes which VGAM215 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6473] Nucleotide sequences of the VGAM215 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM215 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM215 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM215 are further described hereinbelow with reference to Table 1.

[6474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM215 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM215 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6475] As mentioned hereinabove with reference to Fig. 1, a function of VGAM215 gene, herein designated VGAM is inhibition of expression of VGAM215 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM215 correlate with, and may be deduced from, the identity of the target genes which VGAM215 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6476] Adenylate Cyclase 9 (ADCY9, Accession NM_001116) is a VGAM215 host target gene. ADCY9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY9 BINDING SITE, designated SEQ ID:801, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6477] A function of VGAM215 is therefore inhibition of Adeny-

late Cyclase 9 (ADCY9, Accession NM_001116), a gene which . may be a physiologically relevant docking site for calcineurin (by similarity). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY9. The function of ADCY9 has been established by previous studies. The adenylyl cyclases (EC 4.6.1.1) are membrane-associated enzymes that are expressed in most human tissues. These enzymes catalyze the formation of cAMP and are regulated by a family of G protein-coupled receptors, protein kinases, and calcium. The type 9 adenylyl cyclase (ADCY9) is a widely distributed adenylyl cyclase that was originally cloned from mouse (Paterson et al., 1995; Premont et al., 1996). Hacker et al. (1998) cloned human cardiac ADCY9, or AC9, cDNAs and found that the deduced 1,294-amino acid protein is 90% identical to mouse Adcy9. Like mouse Adcy9, the predicted human ADCY9 protein contains 12 transmembrane domains, Asn-linked glycosylation sites, and cAMP-dependent protein kinase phosphorylation sites; however, these proteins differ in the C2b domain due to a frameshift in the human ADCY9 coding sequence relative to the coding sequence of mouse Adcy9. Northern blot analysis detected 8.5- and 6.3-kb

ADCY9 transcripts in all human tissues examined. By fluorescence in situ hybridization, Hacker et al. (1998) mapped the human and mouse ADCY9 genes to 16p13.3 and chromosome 16 band B1, respectively.

[6478] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6479] Premont, R. T.; Matsuoka, I.; Mattei, M. G.; Pouille, Y.; Defer, N.; Hanoune, J. : Identification and characterization of a widely expressed form of adenylyl cyclase. J. Biol. Chem. 271: 13900–13907, 1996. ; and

[6480] Hacker, B. M.; Tomlinson, J. E.; Wayman, G. A.; Sultana, R.; Chan, G.; Villacres, E.; Disteché, C.; Storm, D. R. : Cloning, chromosomal mapping, and regulatory properties of the human ty.

[6481] Further studies establishing the function and utilities of ADCY9 are found in John Hopkins OMIM database record ID 603302, and in cited publications numbered 581–584 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Carnitine Acetyltransferase (CRAT, Accession NM_004003) is another VGAM215 host target gene. CRAT BINDING SITE1 and CRAT BINDING SITE2 are HOST TARGET binding sites

found in untranslated regions of mRNA encoded by CRAT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRAT BINDING SITE1 and CRAT BINDING SITE2, designated SEQ ID:1079 and SEQ ID:771 respectively, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6482] Another function of VGAM215 is therefore inhibition of Carnitine Acetyltransferase (CRAT, Accession NM_004003), a gene which catalyzes the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine. Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRAT. The function of CRAT has been established by previous studies. Carnitine acyltransferases are a group of enzymes that catalyze the reversible transfer of acyl groups from an acyl-CoA thioester to carnitine, thus forming the corresponding acylcarnitine. These enzymes can be distinguished according to their substrate specificity in carnitine palmitoyltransferase (see OMIM Ref. No. CPT1, 600528 and CPT2, 600650), carnitine octanoyltransferase (CROT; 606090), and carnitine acetyltrans-

ferase (EC 2.3.1.7). CRAT is a key enzyme for metabolic pathways involved with the control of the acyl-CoA/CoA ratio in mitochondria, peroxisomes, and endoplasmic reticulum. Acetylcarnitine, which can be a precursor for acetylcholine synthesis catalyzed by choline acetyltransferase, is thought to slow the rate of mental deterioration in Alzheimer patients, and Kalaria and Harik (1992) found decreased function of CRAT in the brain of Alzheimer patients.

[6483] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6484] Kalaria, R. N.; Harik, S. I. : Carnitine acetyltransferase activity in the human brain and its microvessels is decreased in Alzheimer's disease. *Ann. Neurol.* 32: 583–586, 1992. ; and

[6485] van der Leij, F. R.; Huijkman, N. C. A.; Boomsma, C.; Kuipers, J. R. G.; Bartelds, B. : Genomics of the human carnitine acyltransferase genes. *Molec. Genet. Metab.* 71: 139–153, 2000.

[6486] Further studies establishing the function and utilities of CRAT are found in John Hopkins OMIM database record ID 600184, and in cited publications numbered 1769–1771

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758) is another VGAM215 host target gene. AGMAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AGMAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGMAT BINDING SITE, designated SEQ ID:2087, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6487] Another function of VGAM215 is therefore inhibition of Agmatine Ureohydrolase (agmatinase) (AGMAT, Accession NM_024758). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGMAT. DKFZp434E0519 (Accession NM_032247) is another VGAM215 host target gene. DKFZp434E0519 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434E0519, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of DKFZp434E0519 BINDING SITE, designated SEQ ID:2240, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6488] Another function of VGAM215 is therefore inhibition of DKFZp434E0519 (Accession NM_032247). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434E0519. DKFZp762E1312 (Accession NM_018410) is another VGAM215 host target gene. DKFZp762E1312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp762E1312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1312 BINDING SITE, designated SEQ ID:1823, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6489] Another function of VGAM215 is therefore inhibition of DKFZp762E1312 (Accession NM_018410). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZp762E1312. FLJ20619 (Accession NM_017904) is another VGAM215 host target gene. FLJ20619 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20619, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20619 BINDING SITE, designated SEQ ID:1760, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6490] Another function of VGAM215 is therefore inhibition of FLJ20619 (Accession NM_017904). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20619. FLJ20716 (Accession NM_017938) is another VGAM215 host target gene. FLJ20716 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20716, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20716 BINDING SITE, designated SEQ ID:1768, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:550.

[6491] Another function of VGAM215 is therefore inhibition of FLJ20716 (Accession NM_017938). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20716. Frequently Rearranged In Advanced T-cell Lymphomas (FRAT1, Accession NM_005479) is another VGAM215 host target gene. FRAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FRAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FRAT1 BINDING SITE, designated SEQ ID:1217, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6492] Another function of VGAM215 is therefore inhibition of Frequently Rearranged In Advanced T-cell Lymphomas (FRAT1, Accession NM_005479). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FRAT1. KIAA1656 (Accession XM_038022) is another VGAM215 host target gene. KIAA1656 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:2729, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6493] Another function of VGAM215 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1656. Rab11-FIP3 (Accession NM_014700) is another VGAM215 host target gene. Rab11-FIP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP3 BINDING SITE, designated SEQ ID:1524, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6494] Another function of VGAM215 is therefore inhibition of

Rab11-FIP3 (Accession NM_014700). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP3. Translocase of Outer Mitochondrial Membrane 34 (TOMM34, Accession NM_006809) is another VGAM215 host target gene. TOMM34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOMM34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOMM34 BINDING SITE, designated SEQ ID:1332, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6495] Another function of VGAM215 is therefore inhibition of Translocase of Outer Mitochondrial Membrane 34 (TOMM34, Accession NM_006809). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOMM34. LOC146337 (Accession XM_096982) is another VGAM215 host target gene. LOC146337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146337, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146337 BINDING SITE, designated SEQ ID:3285, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6496] Another function of VGAM215 is therefore inhibition of LOC146337 (Accession XM_096982). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146337. LOC147229 (Accession XM_085742) is another VGAM215 host target gene. LOC147229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147229 BINDING SITE, designated SEQ ID:3105, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6497] Another function of VGAM215 is therefore inhibition of LOC147229 (Accession XM_085742). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC147229. LOC158332 (Accession XM_088554) is another VGAM215 host target gene. LOC158332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158332 BINDING SITE, designated SEQ ID:3217, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6498] Another function of VGAM215 is therefore inhibition of LOC158332 (Accession XM_088554). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158332. LOC163131 (Accession XM_092019) is another VGAM215 host target gene. LOC163131 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163131, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163131 BINDING SITE, designated SEQ ID:3245, to

the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6499] Another function of VGAM215 is therefore inhibition of LOC163131 (Accession XM_092019). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163131. LOC221423 (Accession XM_166362) is another VGAM215 host target gene. LOC221423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221423 BINDING SITE, designated SEQ ID:3551, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6500] Another function of VGAM215 is therefore inhibition of LOC221423 (Accession XM_166362). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221423. LOC222182 (Accession XM_168471) is another VGAM215 host target gene. LOC222182 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC222182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222182 BINDING SITE, designated SEQ ID:3639, to the nucleotide sequence of VGAM215 RNA, herein designated VGAM RNA, also designated SEQ ID:550.

[6501] Another function of VGAM215 is therefore inhibition of LOC222182 (Accession XM_168471). Accordingly, utilities of VGAM215 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222182. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 216 (VGAM216) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6502] VGAM216 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM216 was detected is described hereinabove with reference to Figs. 1–8.

[6503] VGAM216 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6504] VGAM216 gene encodes a VGAM216 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM216 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM216 precursor RNA is designated SEQ ID:202, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:202 is located at position 112722 relative to the genome of Vaccinia Virus.

[6505] VGAM216 precursor RNA folds onto itself, forming VGAM216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM216 folded precursor RNA into VGAM216 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM216 RNA is designated SEQ ID:551, and is provided hereinbelow with reference to the sequence listing part.

[6507] VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM216 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6508] VGAM216 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM216 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM216 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6509] The complementary binding of VGAM216 RNA, herein designated VGAM RNA, to host target binding sites on VGAM216 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM216 host tar-

get RNA into VGAM216 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6510] It is appreciated that VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM216 host target genes. The mRNA of each one of this plurality of VGAM216 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM216 RNA, herein designated VGAM RNA, and which when bound by VGAM216 RNA causes inhibition of translation of respective one or more VGAM216 host target proteins.

[6511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM216 gene, herein designated VGAM GENE, on one or more VGAM216 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6512] It is yet further appreciated that a function of VGAM216 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM216 correlate with, and may be deduced from, the identity of the host target genes which VGAM216 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6513] Nucleotide sequences of the VGAM216 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM216 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM216 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM216 are further

described hereinbelow with reference to Table 1.

[6514] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM216 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM216 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6515] As mentioned hereinabove with reference to Fig. 1, a function of VGAM216 gene, herein designated VGAM is inhibition of expression of VGAM216 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM216 correlate with, and may be deduced from, the identity of the target genes which VGAM216 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6516] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781) is a VGAM216 host target gene. B3GALT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of B3GALT3 BINDING SITE, designated SEQ ID:1056, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:551.

[6517] A function of VGAM216 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. LOC159199 (Accession XM_089441) is another VGAM216 host target gene. LOC159199 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159199, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159199 BINDING SITE, designated SEQ ID:3237, to the nucleotide sequence of VGAM216 RNA, herein designated VGAM RNA, also designated SEQ ID:551.

[6518] Another function of VGAM216 is therefore inhibition of LOC159199 (Accession XM_089441). Accordingly, utilities of VGAM216 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC159199. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 217 (VGAM217) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6519] VGAM217 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM217 was detected is described hereinabove with reference to Figs. 1–8.

[6520] VGAM217 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6521] VGAM217 gene encodes a VGAM217 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM217 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM217 precursor RNA is designated SEQ ID:203, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:203 is located at position 113751 relative to the genome of Vaccinia Virus.

[6522] VGAM217 precursor RNA folds onto itself, forming VGAM217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6523] An enzyme complex designated DICER COMPLEX, `dices` the VGAM217 folded precursor RNA into VGAM217 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM217 RNA is designated SEQ ID:552, and is provided hereinbelow with reference to the sequence listing part.

[6524] VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM217 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6525] VGAM217 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM217 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM217 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6526] The complementary binding of VGAM217 RNA, herein designated VGAM RNA, to host target binding sites on VGAM217 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM217 host target RNA into VGAM217 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6527] It is appreciated that VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM217 host target genes. The mRNA of each one of this plurality of VGAM217 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM217 RNA, herein designated VGAM RNA, and which when bound by VGAM217 RNA causes in-

hibition of translation of respective one or more VGAM217 host target proteins.

[6528] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM217 gene, herein designated VGAM GENE, on one or more VGAM217 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6529] It is yet further appreciated that a function of VGAM217 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM217 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM217 correlate with, and may be deduced from, the identity of the host target genes which VGAM217 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6530] Nucleotide sequences of the VGAM217 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM217 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM217 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM217 are further described hereinbelow with reference to Table 1.

[6531] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM217 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM217 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6532] As mentioned hereinabove with reference to Fig. 1, a function of VGAM217 gene, herein designated VGAM is inhibition of expression of VGAM217 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM217 correlate with, and may be deduced from, the identity of the target genes which VGAM217 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6533] Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM_020039) is a VGAM217 host target gene. ACCN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACCN2 BINDING SITE, designated SEQ ID:1891, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6534] A function of VGAM217 is therefore inhibition of Amiloride-sensitive Cation Channel 2, Neuronal (ACCN2, Accession NM_020039). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACCN2. BLAME (Accession NM_020125) is another VGAM217 host target gene. BLAME BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:1892, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6535] Another function of VGAM217 is therefore inhibition of BLAME (Accession NM_020125). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. Distal-less Homeobox 4 (DLX4, Accession NM_138281) is another VGAM217 host target gene. DLX4 BINDING SITE1 and DLX4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DLX4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DLX4 BINDING SITE1 and DLX4 BINDING SITE2, designated SEQ ID:2432 and SEQ ID:870 respectively, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6536] Another function of VGAM217 is therefore inhibition of Distal-less Homeobox 4 (DLX4, Accession NM_138281), a gene which may regulate gene expression, morphogenesis, and differentiation. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DLX4. The function of DLX4 has been established by previous studies. Using degenerate PCR, Nakamura et al. (1996) cloned a gene, which they referred to as DLX7, from human and mouse that may represent the mammalian ortholog of the newt gene NuHBox-5. They isolated a human cDNA predicting a 167-amino acid protein. The homeodomains of these genes are highly similar to those of all other vertebrate DLX genes, but there is divergence upstream of the homeodomain between the human and mouse DLX7 genes and between DLX7 and other DLX genes. They presented evidence that the mouse *Dlx7* gene is alternatively spliced. By Northern blot analysis, Nakamura et al. (1996) found that DLX7 is expressed as a 2.3-kb transcript in several human cell lines. By fluorescence in situ hybridization (FISH), Nakamura et al. (1996) mapped DLX7 to 17q21.3-q22. They stated that the human DLX7 and DLX3 (OMIM Ref. No. 600525) genes are 10 kb apart and are ar-

ranged in a tail-to-tail tandem orientation, similarly to that found in mouse. Using dual-color FISH, Nakamura et al. (1996) determined that human DLX7 and HOX9B (OMIM Ref. No. 142964) lie within 2 Mb of one another. Quinn et al. (1997) undertook a DNA binding site screen of a 32-week human placental cDNA library using a consensus homeodomain binding site as a probe. They claimed that this study represented the first library screen carried out to isolate homeo box genes from the human placenta. They found that 3 homeo box genes known to be expressed in embryo, HB24 (OMIM Ref. No. 142995), GAX (OMIM Ref. No. 600535), and MSX2 (OMIM Ref. No. 123101), are also expressed in the placenta. They also identified a novel homeo box gene, designated DLX4 by them, that showed 85% sequence identity with the homeodomain encoded by the *Drosophila* 'distal-less' gene. Using FISH, they assigned DLX4 to 17q21-q22. This placed DLX4 in the same region of chromosome 17 as a member of the distal-less family gene DLX3 (OMIM Ref. No. 600525) and the HOXB homeo box gene cluster (see OMIM Ref. No. HOXB1; 142968). DLX1 (OMIM Ref. No. 600029) and DLX2 (OMIM Ref. No. 126255) are closely linked on chromosome 2; DLX5 (OMIM Ref. No. 600028)

and DLX6 (OMIM Ref. No. 600030) are closely linked on chromosome 7. Thus, Quinn et al. (1997) predicted that DLX3 and DLX4 are closely linked and that they arose through gene duplication and divergence from a common ancestral precursor.

[6537] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6538] Morasso, M. I.; Yonescu, R.; Griffin, C. A.; Sargent, T. D. : Localization of human DLX8 to chromosome 17q21.3–q22 by fluorescence in situ hybridization. *Mammalian Genome* 8: 302–303, 1997. ; and

[6540] Further studies establishing the function and utilities of DLX4 are found in John Hopkins OMIM database record ID 601911, and in cited publications numbered 205 and 2056 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol 1,4,5–triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is another VGAM217 host target gene. ITPR2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:912, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6541] Another function of VGAM217 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM_002225) is another VGAM217 host target gene. IVD BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IVD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IVD BINDING SITE, designated SEQ ID:913, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6542] Another function of VGAM217 is therefore inhibition of Isovaleryl Coenzyme A Dehydrogenase (IVD, Accession NM_002225). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IVD. Mitogen-activated Protein Kinase Kinase Kinase Kinase 2 (MAP4K2, Accession NM_004579) is another VGAM217 host target gene. MAP4K2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP4K2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP4K2 BINDING SITE, designated SEQ ID:1127, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6543] Another function of VGAM217 is therefore inhibition of Mitogen-activated Protein Kinase Kinase Kinase Kinase 2 (MAP4K2, Accession NM_004579), a gene which serine/threonine protein kinase required for spore wall development. activates Jun N-terminal kinase; member of the STE20 kinase family. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MAP4K2. The function of MAP4K2 has been established by previous studies. B lymphocytes that reside in the germinal center of lymphoid follicles are functionally and phenotypically distinct from those residing in the surrounding mantle zone. Various regulatory and structural genes control a complex series of differentiation and selection steps through which B cells that exit the germinal center of lymphoid follicles must pass. In differential hybridization studies to identify some of these genes, Katz et al. (1994) isolated a novel gene based on its preferential expression in tonsillar germinal center B lymphocytes. The complete nucleotide sequence predicted a 819-amino acid protein, named GC (for 'germinal center') kinase, with homology to serine-threonine protein kinases. Its catalytic domain was 39% and 37% identical to those of *S. cerevisiae* STE20 and *Drosophila* NinaC proteins, respectively. Northern blot analysis revealed expression of a 2.9-kb mRNA in several human tissues, including brain, lung, and placenta. In situ hybridization of tonsil tissue demonstrated preferential hybridization to the germinal center region. The expressed protein phosphorylated casein and myelin basic protein in in vitro kinase assays Ren et al. (1996) identi-

fied a mouse protein based on its interaction with the vesicular transport protein Rab8 (OMIM Ref. No. 165040). This mouse protein, termed Rab8ip, and GC kinase shared 93% amino acid sequence identity. Rab8ip/GC kinase had serine/threonine protein kinase activity manifested both as autophosphorylation and phosphorylation of casein and myelin basic protein. Based on its interaction with Rab8, the authors suggested that Rab8ip/GC kinase may modulate secretion in response to stress stimuli. Guru et al. (1997) mapped and sequenced the MEN1 (OMIM Ref. No. 131100) genomic region at 11q13. They identified MAP4K2 in the region between PYGM (OMIM Ref. No. 232600) and marker D11S4936.

[6544] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6545] Katz, P.; Whalen, G.; Kehrl, J. H. : Differential expression of a novel protein kinase in human B lymphocytes: preferential localization in the germinal center. J. Biol. Chem. 269: 16802–16809, 1994. ; and

Boguski.

[6547] Further studies establishing the function and utilities of MAP4K2 are found in John Hopkins OMIM database record ID 603166, and in cited publications numbered 2661–1350 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Polymerase (DNA directed), Gamma (POLG, Accession NM_002693) is another VGAM217 host target gene. POLG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLG BINDING SITE, designated SEQ ID:948, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6548] Another function of VGAM217 is therefore inhibition of Polymerase (DNA directed), Gamma (POLG, Accession NM_002693). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLG. Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession

NM_020630) is another VGAM217 host target gene. RET BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RET, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RET BINDING SITE, designated SEQ ID:1920, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6549] Another function of VGAM217 is therefore inhibition of Ret Proto-oncogene (multiple endocrine neoplasia and medullary thyroid carcinoma 1, Hirschsprung disease) (RET, Accession NM_020630), a gene which transduces signals for cell growth and differentiation. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RET. The function of RET has been established by previous studies. Using the approach of SSCP analysis established for all 20 exons of the RET gene, Seri et al. (1997) identified 7 additional mutations among 39 sporadic and familial cases of Hirschsprung disease (detection rate 18%). They considered that the relatively low efficiency of detecting mutations of RET in Hirschsprung pa-

tients cannot be accounted for by genetic heterogeneity, which is not supported by the results of linkage analysis in pedigrees analyzed to date. Almost 74% of the point mutations in their series, as well as in other patient series, were identified among long-segment patients, who represented only 25% of the patient population. Seri et al. (1997) found a C620R substitution in a patient affected with total colonic aganglionosis; the same mutation had been found in medullary thyroid carcinoma. An R313Q mutation (164761.0026) was identified in homozygous state in a child born of consanguineous parents and was associated with the most severe Hirschsprung phenotype, namely, a total colonic aganglionosis with small bowel involvement. Eng (1996) reviewed the role of the RET protooncogene in multiple endocrine neoplasia type II and in Hirschsprung disease. Hoppener and Lips (1996) also reviewed RET gene mutations from the point of view of the molecular biology and the clinical aspects. Eng and Mulligan (1997) tabulated mutations of the RET gene in MEN2, the related sporadic tumors medullary thyroid carcinoma and pheochromocytoma, and familial and sporadic Hirschsprung disease. Germline mutations in 1 of 8 codons within RET cause the 3 subtypes of MEN2, namely,

MEN2A, MEN2B, and familial medullary thyroid carcinoma. They stated that a somatic M918T mutation (164761.0013) accounts for the largest proportion of RET mutations detected in medullary thyroid carcinomas, most series showing a 30% to 50% range. It appeared that pheochromocytomas have a wider range of RET mutations. In contrast to MEN2, approximately 25% of patients with Hirschsprung disease have germline mutations scattered throughout the length of RET.

[6550] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6551] Seri, M.; Yin, L.; Barone, A.; Bolino, A.; Celli, I.; Bocciardi, R.; Pasini, B.; Ceccherini, I.; Lerone, M.; Kristoffersson, U.; Larsson, L. T.; Casasa, J. M.; Cass, D. T.; Abramowicz, M. J.; Vanderwinden, J.-M.; Kravcenkiene, I.; Baric, I.; Silengo, M.; Martucciello, G.; Romeo, G. : Frequency of RET mutations in long- and short-segment Hirschsprung disease. Hum. Mutat. 9: 243-249, 1997. ; and

[6552] Hoppener, J. W. M.; Lips, C. J. M. : RET receptor tyrosine kinase gene mutations: molecular biological, physiological and clinical aspects. Europ. J. Clin. Invest. 26: 613-624, 1996.

[6553] Further studies establishing the function and utilities of RET are found in John Hopkins OMIM database record ID 164761, and in cited publications numbered 585–589, 593–592, 594–597, 2480–893, 2481–2482, 906, 861–736, 2646–741, 2935–745, 894–748, 810–816, 2483–823, 825, 829–828, 1162–1164, 293 and 1167–1173 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sal-like 2 (Drosophila) (SALL2, Accession XM_033473) is another VGAM217 host target gene. SALL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:2672, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6554] Another function of VGAM217 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM_033473). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL2. Solute Carrier Family 9

(sodium/hydrogen exchanger), Isoform 1 (antiporter, Na^+/H^+ , amiloride sensitive) (SLC9A1, Accession XM_046881) is another VGAM217 host target gene. SLC9A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC9A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC9A1 BINDING SITE, designated SEQ ID:2886, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6555] Another function of VGAM217 is therefore inhibition of Solute Carrier Family 9 (sodium/hydrogen exchanger), Isoform 1 (antiporter, Na^+/H^+ , amiloride sensitive) (SLC9A1, Accession XM_046881), a gene which is involved in pH regulation to eliminate acids generated by active metabolism or to counter adverse environmental conditions. Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC9A1. The function of SLC9A1 has been established by previous studies. Denker et al. (2000) showed that the plasma membrane ion exchanger NHE1

acts as an anchor for actin filaments to control the integrity of the cortical cytoskeleton. This occurs through a previously unrecognized structural link between NHE1 and the actin-binding proteins ezrin (OMIM Ref. No. 123900), radixin (OMIM Ref. No. 179410), and moesin (OMIM Ref. No. 309845), which are collectively referred to as ERM proteins. NHE1 and ERM proteins were found to associate directly and colocalize in lamellipodia. Fibroblasts expressing NHE1 with mutations that disrupted binding with ERM proteins but not ion translocation had impaired organization of focal adhesions and actin stress fibers and an irregular cell shape. Denker et al. (2000) proposed a structural role for NHE1 in regulating the cortical cytoskeleton that is independent of its function as an ion exchanger. The genomic probe reported by Mattei et al. (1987) was used to map the APNH gene to 1p36.1-p35 by in situ hybridization (Mattei et al., 1988). Mattei et al. (1989) used in situ hybridization of the human cDNA probe to map the antiporter gene to the distal portion of mouse chromosome 4 and to the long arm of Chinese hamster chromosome 2, confirming the conserved homology between the distal part of human chromosome 1p, the mouse distal 4, and Chinese hamster distal 2q. By the

analysis of fragment length variations in recombinant inbred strains, Morahan and Rakar (1993) likewise mapped the Nhe1 gene to mouse chromosome 4, between Lck and Akp2. Lifton et al. (1990) used genomic clones of the SLC9A1 gene to identify 2 polymorphisms. Using these RFLPs in 59 reference families, they found that the antiporter gene lies 3 cM proximal to the RH locus. Dudley et al. (1990) PCR-amplified a 376-bp fragment corresponding to the 5-prime end of SLC9A1 and detected a polymorphism within this fragment by denaturing gradient gel electrophoresis. By genetic linkage studies, they mapped SLC9A1 telomeric to D1S57 and close to RH (OMIM Ref. No. 111700) and ALPL (OMIM Ref. No. 171760). They pointed out that SLC9A1 is a plausible candidate gene for human essential hypertension.

[6556] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6557] Denker, S. P.; Huang, D. C.; Orlowski, J.; Furthmayr, H.; Barber, D. L. : Direct binding of the Na-H exchanger NHE1 to ERM proteins regulates the cortical cytoskeleton and cell shape independently of H(+) translocation. Molec. Cell 6: 1425-1436, 2000. ; and

- [6558] Dudley, C. R. K.; Giuffra, L. A.; Tippet, P.; Kidd, K. K.; Reeder, S. T. : The Na⁺/H⁺ antiporter: a 'melt' polymorphism allows regional mapping to the short arm of chromosome 1. Hum. G.
- [6559] Further studies establishing the function and utilities of SLC9A1 are found in John Hopkins OMIM database record ID 107310, and in cited publications numbered 907–916 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 132 (clone pHZ-12) (ZNF132, Accession NM_003433) is another VGAM217 host target gene. ZNF132 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF132 BINDING SITE, designated SEQ ID:1020, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.
- [6560] Another function of VGAM217 is therefore inhibition of Zinc Finger Protein 132 (clone pHZ-12) (ZNF132, Accession NM_003433). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with ZNF132. AD-020 (Accession NM_020141) is another VGAM217 host target gene. AD-020 BINDING SITE1 and AD-020 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AD-020, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AD-020 BINDING SITE1 and AD-020 BINDING SITE2, designated SEQ ID:1893 and SEQ ID:2524 respectively, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6561] Another function of VGAM217 is therefore inhibition of AD-020 (Accession NM_020141). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AD-020. DJ473B4 (Accession NM_019556) is another VGAM217 host target gene. DJ473B4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DJ473B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ473B4 BINDING SITE,

designated SEQ ID:1881, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6562] Another function of VGAM217 is therefore inhibition of DJ473B4 (Accession NM_019556). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ473B4. KIAA0475 (Accession NM_014864) is another VGAM217 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1571, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6563] Another function of VGAM217 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. KIAA1729 (Accession XM_114418) is another VGAM217 host target gene. KIAA1729 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:3458, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6564] Another function of VGAM217 is therefore inhibition of KIAA1729 (Accession XM_114418). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759) is another VGAM217 host target gene. PHYHIP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PHYHIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHYHIP BINDING SITE, designated SEQ ID:1541, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6565] Another function of VGAM217 is therefore inhibition of Phytanoyl-CoA Hydroxylase Interacting Protein (PHYHIP, Accession NM_014759). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHYHIP. SCAMP-4 (Accession NM_079834) is another VGAM217 host target gene. SCAMP-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAMP-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAMP-4 BINDING SITE, designated SEQ ID:2372, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6566] Another function of VGAM217 is therefore inhibition of SCAMP-4 (Accession NM_079834). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAMP-4. ST6GalNAcI (Accession NM_018414) is another VGAM217 host target gene. ST6GalNAcI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ST6GalNAcI, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ST6GalNAcI BINDING SITE, designated SEQ ID:1824, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6567] Another function of VGAM217 is therefore inhibition of ST6GalNAcI (Accession NM_018414). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ST6GalNAcI. Testis-specific Transcript, Y-linked 2 (TTY2, Accession XM_099029) is another VGAM217 host target gene. TTY2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TTY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTY2 BINDING SITE, designated SEQ ID:3396, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6568] Another function of VGAM217 is therefore inhibition of Testis-specific Transcript, Y-linked 2 (TTY2, Accession

XM_099029). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTTY2. LOC126917 (Accession XM_059091) is another VGAM217 host target gene. LOC126917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126917 BINDING SITE, designated SEQ ID:3001, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6569] Another function of VGAM217 is therefore inhibition of LOC126917 (Accession XM_059091). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126917. LOC128077 (Accession XM_059208) is another VGAM217 host target gene. LOC128077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC128077 BINDING SITE, designated SEQ ID:3007, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6570] Another function of VGAM217 is therefore inhibition of LOC128077 (Accession XM_059208). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128077. LOC152485 (Accession XM_087479) is another VGAM217 host target gene. LOC152485 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152485, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152485 BINDING SITE, designated SEQ ID:3171, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6571] Another function of VGAM217 is therefore inhibition of LOC152485 (Accession XM_087479). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152485. LOC159148 (Accession XM_099030) is an-

other VGAM217 host target gene. LOC159148 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC159148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159148 BINDING SITE, designated SEQ ID:3397, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6572] Another function of VGAM217 is therefore inhibition of LOC159148 (Accession XM_099030). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159148. LOC159989 (Accession XM_089976) is another VGAM217 host target gene. LOC159989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC159989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC159989 BINDING SITE, designated SEQ ID:3238, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6573] Another function of VGAM217 is therefore inhibition of LOC159989 (Accession XM_089976). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC159989. LOC164584 (Accession XM_092883) is another VGAM217 host target gene. LOC164584 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164584, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164584 BINDING SITE, designated SEQ ID:3250, to the nucleotide sequence of VGAM217 RNA, herein designated VGAM RNA, also designated SEQ ID:552.

[6574] Another function of VGAM217 is therefore inhibition of LOC164584 (Accession XM_092883). Accordingly, utilities of VGAM217 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164584. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 218 (VGAM218) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[6575] VGAM218 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM218 was detected is described hereinabove with reference to Figs. 1–8.

[6576] VGAM218 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6577] VGAM218 gene encodes a VGAM218 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM218 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM218 precursor RNA is designated SEQ ID:204, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:204 is located at position 114325 relative to the genome of Vaccinia Virus.

[6578] VGAM218 precursor RNA folds onto itself, forming VGAM218 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6579] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM218 folded precursor RNA into VGAM218 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 73%) nucleotide se-
quence of VGAM218 RNA is designated SEQ ID:553, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6580] VGAM218 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM218 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM218 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6581] VGAM218 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM218 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM218 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6582] The complementary binding of VGAM218 RNA, herein designated VGAM RNA, to host target binding sites on VGAM218 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM218 host target RNA into VGAM218 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6583] It is appreciated that VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM218 host target genes. The mRNA of each one of this plurality of VGAM218 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM218 RNA, herein designated VGAM RNA, and which when bound by VGAM218 RNA causes inhibition of translation of respective one or more VGAM218 host target proteins.

[6584] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM218 gene, herein designated VGAM GENE, on one or more VGAM218 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6585] It is yet further appreciated that a function of VGAM218 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM218 correlate with, and may be deduced from, the identity of the host target genes which VGAM218 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [6586] Nucleotide sequences of the VGAM218 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM218 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM218 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM218 are further described hereinbelow with reference to Table 1.
- [6587] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM218 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM218 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6588] As mentioned hereinabove with reference to Fig. 1, a function of VGAM218 gene, herein designated VGAM is inhibition of expression of VGAM218 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM218 correlate with, and may be deduced from, the identity of the target genes which VGAM218 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6589] Recombination Activating Gene 1 (RAG1, Accession NM_000448) is a VGAM218 host target gene. RAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAG1 BINDING SITE, designated SEQ ID:745, to the nucleotide sequence of VGAM218 RNA, herein designated VGAM RNA, also designated SEQ ID:553.

[6590] A function of VGAM218 is therefore inhibition of Recombination Activating Gene 1 (RAG1, Accession NM_000448). Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAG1. LOC221964 (Accession XM_168342) is another VGAM218 host target gene. LOC221964 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221964, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221964 BINDING SITE, designated SEQ ID:3628, to the nucleotide sequence of

VGAM218 RNA, herein designated VGAM RNA, also designated SEQ ID:553.

[6591] Another function of VGAM218 is therefore inhibition of LOC221964 (Accession XM_168342). Accordingly, utilities of VGAM218 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221964. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 219 (VGAM219) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6592] VGAM219 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM219 was detected is described hereinabove with reference to Figs. 1–8.

[6593] VGAM219 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6594] VGAM219 gene encodes a VGAM219 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM219 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM219 precursor RNA is designated SEQ ID:205, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:205 is located at position 115962 relative to the genome of Vaccinia Virus.

[6595] VGAM219 precursor RNA folds onto itself, forming VGAM219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6596] An enzyme complex designated DICER COMPLEX, `dices` the VGAM219 folded precursor RNA into VGAM219 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM219 RNA is designated SEQ ID:554, and is provided hereinbelow with reference to the sequence listing part.

[6597] VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM219 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6598] VGAM219 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM219 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM219 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6599] The complementary binding of VGAM219 RNA, herein designated VGAM RNA, to host target binding sites on VGAM219 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM219 host target RNA into VGAM219 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6600] It is appreciated that VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM219 host target genes. The mRNA of each one of this plurality of VGAM219 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM219 RNA, herein designated VGAM RNA, and which when bound by VGAM219 RNA causes inhibition of translation of respective one or more VGAM219 host target proteins.

[6601] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM219 gene, herein designated VGAM GENE, on one or more VGAM219 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[6602] It is yet further appreciated that a function of VGAM219 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM219 correlate with, and may be deduced from, the identity of the host target genes which VGAM219 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6603] Nucleotide sequences of the VGAM219 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM219 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM219 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM219 are further described hereinbelow with reference to Table 1.

[6604] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM219 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM219 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6605] As mentioned hereinabove with reference to Fig. 1, a function of VGAM219 gene, herein designated VGAM is inhibition of expression of VGAM219 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM219 correlate with, and may be deduced from, the identity of the target genes which VGAM219 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6606] A Disintegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474) is a VGAM219 host target gene. ADAM12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAM12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM12 BINDING SITE, designated SEQ ID:1030, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:554.

[6607] A function of VGAM219 is therefore inhibition of A Disin-

tegrin and Metalloproteinase Domain 12 (meltrin alpha) (ADAM12, Accession NM_003474), a gene which involved in skeletal muscle regeneration, specifically at the onset of cell fusion. Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM12. The function of ADAM12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM199. KIAA1789 (Accession XM_040486) is another VGAM219 host target gene. KIAA1789 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1789, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1789 BINDING SITE, designated SEQ ID:2780, to the nucleotide sequence of VGAM219 RNA, herein designated VGAM RNA, also designated SEQ ID:554.

[6608] Another function of VGAM219 is therefore inhibition of KIAA1789 (Accession XM_040486). Accordingly, utilities of VGAM219 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1789. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 220 (VGAM220) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6609] VGAM220 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM220 was detected is described hereinabove with reference to Figs. 1–8.

[6610] VGAM220 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6611] VGAM220 gene encodes a VGAM220 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM220 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM220 precursor RNA is designated SEQ ID:206, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:206 is located at position 115869 relative to the genome of Vaccinia Virus.

[6612] VGAM220 precursor RNA folds onto itself, forming VGAM220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6613] An enzyme complex designated DICER COMPLEX, `dices` the VGAM220 folded precursor RNA into VGAM220 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM220 RNA is designated SEQ ID:555, and is provided hereinbelow with reference to the sequence listing part.

[6614] VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM220 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6615] VGAM220 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM220 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM220 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6616] The complementary binding of VGAM220 RNA, herein designated VGAM RNA, to host target binding sites on VGAM220 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM220 host target RNA into VGAM220 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6617] It is appreciated that VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM220 host target genes. The mRNA of each one of this plurality of VGAM220 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM220 RNA, herein designated VGAM RNA, and which when bound by VGAM220 RNA causes in-

hibition of translation of respective one or more VGAM220 host target proteins.

[6618] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM220 gene, herein designated VGAM GENE, on one or more VGAM220 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6619] It is yet further appreciated that a function of VGAM220 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM220 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM220 correlate with, and may be deduced from, the identity of the host target genes which VGAM220 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6620] Nucleotide sequences of the VGAM220 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM220 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM220 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM220 are further described hereinbelow with reference to Table 1.

[6621] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM220 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM220 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6622] As mentioned hereinabove with reference to Fig. 1, a function of VGAM220 gene, herein designated VGAM is inhibition of expression of VGAM220 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM220 correlate with, and may be deduced from, the identity of the target genes which VGAM220 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6623] Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186) is a VGAM220 host target gene. NR4A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR4A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR4A2 BINDING SITE, designated SEQ ID:1276, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:555.

[6624] A function of VGAM220 is therefore inhibition of Nuclear Receptor Subfamily 4, Group A, Member 2 (NR4A2, Accession NM_006186), a gene which may be a general coactivator of transcription. Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR4A2. The function of NR4A2 and its association with various diseases

and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM148. LOC51145 (Accession NM_016158) is another VGAM220 host target gene. LOC51145 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51145, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51145 BINDING SITE, designated SEQ ID:1667, to the nucleotide sequence of VGAM220 RNA, herein designated VGAM RNA, also designated SEQ ID:555.

[6625] Another function of VGAM220 is therefore inhibition of LOC51145 (Accession NM_016158). Accordingly, utilities of VGAM220 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51145. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 221 (VGAM221) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6626] VGAM221 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM221 was detected is described hereinabove with reference to Figs. 1–8.

[6627] VGAM221 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6628] VGAM221 gene encodes a VGAM221 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM221 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM221 precursor RNA is designated SEQ ID:207, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:207 is located at position 116795 relative to the genome of Vaccinia Virus.

[6629] VGAM221 precursor RNA folds onto itself, forming VGAM221 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6630] An enzyme complex designated DICER COMPLEX, `dices` the VGAM221 folded precursor RNA into VGAM221 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM221 RNA is designated SEQ ID:556, and is provided hereinbelow with reference to the sequence listing part.

[6631] VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM221 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[6632] VGAM221 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM221 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM221 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6633] The complementary binding of VGAM221 RNA, herein designated VGAM RNA, to host target binding sites on VGAM221 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM221 host target RNA into VGAM221 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6634] It is appreciated that VGAM221 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM221 host target genes. The mRNA of each one of this plurality of VGAM221 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM221 RNA, herein designated VGAM RNA, and which when bound by VGAM221 RNA causes inhibition of translation of respective one or more VGAM221 host target proteins.

[6635] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM221 gene, herein designated VGAM GENE, on one or more VGAM221 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6636] It is yet further appreciated that a function of VGAM221 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM221 correlate with, and may be deduced from, the identity of the host target genes which VGAM221 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6637] Nucleotide sequences of the VGAM221 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM221 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM221 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM221 are further
described hereinbelow with reference to Table 1.

[6638] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM221 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM221 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[6639] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM221 gene, herein designated VGAM is
inhibition of expression of VGAM221 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM221 correlate with, and may be deduced
from, the identity of the target genes which VGAM221
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[6640] Hemochromatosis (HFE, Accession NM_000410) is a
VGAM221 host target gene. HFE BINDING SITE1 and HFE

BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HFE, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HFE BINDING SITE1 and HFE BINDING SITE2, designated SEQ ID:738 and SEQ ID:2464 respectively, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:556.

[6641] A function of VGAM221 is therefore inhibition of Hemochromatosis (HFE, Accession NM_000410). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HFE. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM221 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:943, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ

ID:556.

[6642] Another function of VGAM221 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50.FLJ20371 (Accession NM_017791) is another VGAM221 host target gene. FLJ20371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20371 BINDING SITE, designated SEQ ID:1752, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:556.

[6643] Another function of VGAM221 is therefore inhibition of FLJ20371 (Accession NM_017791). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ20371. LOC202052 (Accession XM_117355) is another VGAM221 host target gene. LOC202052 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202052, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202052 BINDING SITE, designated SEQ ID:3485, to the nucleotide sequence of VGAM221 RNA, herein designated VGAM RNA, also designated SEQ ID:556.

[6644] Another function of VGAM221 is therefore inhibition of LOC202052 (Accession XM_117355). Accordingly, utilities of VGAM221 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202052. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 222 (VGAM222) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6645] VGAM222 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM222 was detected is described hereinabove with reference to Figs. 1–8.

[6646] VGAM222 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6647] VGAM222 gene encodes a VGAM222 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM222 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM222 precursor RNA is designated SEQ ID:208, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:208 is located at position 117498 relative to the genome of Vaccinia Virus.

[6648] VGAM222 precursor RNA folds onto itself, forming VGAM222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6649] An enzyme complex designated DICER COMPLEX, `dices` the VGAM222 folded precursor RNA into VGAM222 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM222 RNA is designated SEQ ID:557, and is provided hereinbelow with reference to the sequence listing part.

[6650] VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM222 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6651] VGAM222 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM222 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM222 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6652] The complementary binding of VGAM222 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM222 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM222 host target RNA into VGAM222 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6653] It is appreciated that VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM222 host target genes. The mRNA of each one of this plurality of VGAM222 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM222 RNA, herein designated VGAM RNA, and which when bound by VGAM222 RNA causes inhibition of translation of respective one or more VGAM222 host target proteins.

[6654] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM222 gene, herein designated VGAM GENE, on one or more VGAM222 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6655] It is yet further appreciated that a function of VGAM222 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM222 correlate with, and may be deduced from, the identity of the host target genes which VGAM222 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6656] Nucleotide sequences of the VGAM222 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM222 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM222 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM222 are further described hereinbelow with reference to Table 1.

[6657] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM222 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM222 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6658] As mentioned hereinabove with reference to Fig. 1, a function of VGAM222 gene, herein designated VGAM is inhibition of expression of VGAM222 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM222 correlate with, and may be deduced from, the identity of the target genes which VGAM222 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6659] Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is a VGAM222 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found

in the 3` untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:1413, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:557.

[6660] A function of VGAM222 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM131. Fragile X Mental Retardation 2 (FMR2, Accession NM_002025) is another VGAM222 host target gene. FMR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FMR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of FMR2 BINDING SITE, designated SEQ ID:888, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:557.

[6661] Another function of VGAM222 is therefore inhibition of Fragile X Mental Retardation 2 (FMR2, Accession NM_002025). Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR2. FLJ13612 (Accession NM_025202) is another VGAM222 host target gene. FLJ13612 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13612, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13612 BINDING SITE, designated SEQ ID:2146, to the nucleotide sequence of VGAM222 RNA, herein designated VGAM RNA, also designated SEQ ID:557.

[6662] Another function of VGAM222 is therefore inhibition of FLJ13612 (Accession NM_025202). Accordingly, utilities of VGAM222 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13612.

Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 223 (VGAM223) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6663] VGAM223 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM223 was detected is described hereinabove with reference to Figs. 1–8.

[6664] VGAM223 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6665] VGAM223 gene encodes a VGAM223 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM223 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM223 precursor RNA is designated SEQ ID:209, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:209 is

located at position 117715 relative to the genome of Vaccinia Virus.

[6666] VGAM223 precursor RNA folds onto itself, forming VGAM223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6667] An enzyme complex designated DICER COMPLEX, `dices` the VGAM223 folded precursor RNA into VGAM223 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM223 RNA is designated SEQ ID:558, and is provided hereinbelow with reference to the sequence listing part.

[6668] VGAM223 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM223 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6669] VGAM223 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM223 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM223 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM223 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[6670] The complementary binding of VGAM223 RNA, herein designated VGAM RNA, to host target binding sites on VGAM223 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM223 host target RNA into VGAM223 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6671] It is appreciated that VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM223 host target genes. The mRNA of each one of this plurality of VGAM223 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM223 RNA, herein designated VGAM RNA, and which when bound by VGAM223 RNA causes inhibition of translation of respective one or more VGAM223

host target proteins.

[6672] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM223 gene, herein designated VGAM GENE, on one or more VGAM223 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6673] It is yet further appreciated that a function of VGAM223 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM223 correlate with, and may be deduced from, the identity of the host target genes which VGAM223 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6674] Nucleotide sequences of the VGAM223 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM223 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM223 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM223 are further described hereinbelow with reference to Table 1.

[6675] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM223 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM223 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6676] As mentioned hereinabove with reference to Fig. 1, a function of VGAM223 gene, herein designated VGAM is inhibition of expression of VGAM223 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM223 correlate with, and may be deduced from, the identity of the target genes which VGAM223 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6677] Hermansky-Pudlak Syndrome 4 (HPS4, Accession NM_022081) is a VGAM223 host target gene. HPS4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HPS4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPS4 BINDING SITE, designated SEQ ID:1977, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:558.

[6678] A function of VGAM223 is therefore inhibition of Hermansky-Pudlak Syndrome 4 (HPS4, Accession NM_022081). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPS4. Tektin 1 (TEKT1, Accession NM_053285) is another VGAM223 host target gene. TEKT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TEKT1, corresponding to a HOST TARGET binding site such as

BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEK1 BINDING SITE, designated SEQ ID:2359, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:558.

[6679] Another function of VGAM223 is therefore inhibition of Tek1 (TEK1, Accession NM_053285). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEK1. LOC145783 (Accession XM_085231) is another VGAM223 host target gene. LOC145783 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145783, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145783 BINDING SITE, designated SEQ ID:3082, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:558.

[6680] Another function of VGAM223 is therefore inhibition of LOC145783 (Accession XM_085231). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC145783. LOC154321 (Accession XM_087906) is another VGAM223 host target gene. LOC154321 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154321 BINDING SITE, designated SEQ ID:3190, to the nucleotide sequence of VGAM223 RNA, herein designated VGAM RNA, also designated SEQ ID:558.

[6681] Another function of VGAM223 is therefore inhibition of LOC154321 (Accession XM_087906). Accordingly, utilities of VGAM223 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154321. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 224 (VGAM224) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6682] VGAM224 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM224 was detected is described hereinabove with reference to Figs. 1–8.

[6683] VGAM224 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6684] VGAM224 gene encodes a VGAM224 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM224 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM224 precursor RNA is designated SEQ ID:210, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:210 is located at position 119904 relative to the genome of Vaccinia Virus.

[6685] VGAM224 precursor RNA folds onto itself, forming VGAM224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6686] An enzyme complex designated DICER COMPLEX, `dices` the VGAM224 folded precursor RNA into VGAM224 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 81%) nucleotide sequence of VGAM224 RNA is designated SEQ ID:559, and is provided hereinbelow with reference to the sequence listing part.

[6687] VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM224 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6688] VGAM224 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM224 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM224 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[6689] The complementary binding of VGAM224 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM224 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM224 host target RNA into VGAM224 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6690] It is appreciated that VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM224 host target genes. The mRNA of each one of this plurality of VGAM224 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM224 RNA, herein designated VGAM RNA, and which when bound by VGAM224 RNA causes inhibition of translation of respective one or more VGAM224 host target proteins.

[6691] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM224 gene, herein designated VGAM GENE, on one or more VGAM224 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6692] It is yet further appreciated that a function of VGAM224 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM224 correlate with, and may be deduced from, the identity of the host target genes which VGAM224 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6693] Nucleotide sequences of the VGAM224 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM224 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM224 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM224 are further described hereinbelow with reference to Table 1.

[6694] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM224 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM224 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6695] As mentioned hereinabove with reference to Fig. 1, a function of VGAM224 gene, herein designated VGAM is inhibition of expression of VGAM224 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM224 correlate with, and may be deduced from, the identity of the target genes which VGAM224 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6696] Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549) is a VGAM224 host target gene. FEZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEZ1,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:1993, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6697] A function of VGAM224 is therefore inhibition of Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to C. elegans UNC-76. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1. The function of FEZ1 has been established by previous studies. Ishii et al. (1999) positionally cloned and characterized the FEZ1/LZTS1 (leucine zipper, putative tumor suppressor-1) gene at 8p22, a region that is lost in many tumors, including prostate, breast, head and neck, esophageal, and urinary bladder carcinomas. The predicted FEZ1 protein contained a leucine-zipper region with similarity to the DNA-binding domain of the cAMP-responsive activating transcription factor-5 (OMIM Ref. No. 606398). Northern blot analysis revealed that FEZ2 is expressed almost ubiquitously in

normal tissues, although expression is most abundant in testes. FEZ1 expression was undetectable in more than 60% of epithelial tumors, but FEZ1 mutations were found in primary esophageal cancers and in a prostate cancer cell line. Transcript analysis from several FEZ1-expressing tumors revealed truncated mRNAs, including a frameshift. Alteration and inactivation of the FEZ1 gene may play a role in various human tumors. Ishii et al. (2001) showed that introduction of FEZ1/LZTS1 into FEZ1/LZTS1-negative cancer cells resulted in suppression of tumorigenicity and reduced cell growth with accumulation of cells at late S-G2/M stage of the cell cycle. Their data showed that FEZ1/LZTS1 inhibits cancer cell growth through regulation of mitosis, and that its alterations result in abnormal cell growth. Ishii et al. (1999) analyzed the nucleotide sequence of the FEZ1 gene open reading frame in 194 cancers, including 72 primary esophageal cancers. They found a point mutation in 2 primary esophageal cancers and in a prostate cancer cell line.

[6698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

FEZ1/LZTS1 gene at 8p22 suppresses cancer cell growth
and regula.

[6701] Further studies establishing the function and utilities of
FEZ1 are found in John Hopkins OMIM database record ID
606551, and in cited publications numbered 1050 listed
in the bibliography section hereinbelow, which are also
hereby incorporated by reference. Golgi Autoantigen, Gol-
gin Subfamily A, 4 (GOLGA4, Accession XM_011069) is
another VGAM224 host target gene. GOLGA4 BINDING
SITE is HOST TARGET binding site found in the 5` un-
translated region of mRNA encoded by GOLGA4, corre-
sponding to a HOST TARGET binding site such as BINDING
SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-
trates the complementarity of the nucleotide sequences of
GOLGA4 BINDING SITE, designated SEQ ID:2554, to the
nucleotide sequence of VGAM224 RNA, herein designated

VGAM RNA, also designated SEQ ID:559.

[6702] Another function of VGAM224 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 4 (GOLGA4, Accession XM_011069), a gene which may play a role in vesicular transport from the trans- golgi. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA4. The function of GOLGA4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM181. Hyaluronan Synthase 3 (HAS3, Accession NM_005329) is another VGAM224 host target gene. HAS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HAS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAS3 BINDING SITE, designated SEQ ID:1199, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6703] Another function of VGAM224 is therefore inhibition of Hyaluronan Synthase 3 (HAS3, Accession NM_005329), a gene which plays a role in hyaluronan/hyaluronic acid (ha)

synthesis. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAS3. The function of HAS3 has been established by previous studies. Hyaluronan (HA) is an unbranched glycosaminoglycan composed of repeating disaccharide units. It is a major constituent of the extracellular matrix and has been implicated in development, tumorigenesis, and several diseases. HA is synthesized at the inner face of the plasma membrane and is subsequently extruded to the outside of the cell. By degenerate PCR, Spicer et al. (1997) isolated a genomic fragment of human HA synthase-3 (HAS3) and genomic and cDNA clones of mouse Has3. The amino acid sequences encoded by the partial HAS3 fragment and the corresponding region of Has3 are 99% conserved. The authors noted that the high degree of sequence conservation between specific human and mouse HASs contrasts with the lower level of identity between HASs within a species, suggesting an evolutionary conservation of functionally important residues and differences in the mode of action of the various HASs. The predicted 554-amino acid Has3 has several consensus HA-binding motifs and multiple transmembrane domains, with 2 at the N terminus and

a cluster at the C terminus. Expression of Has3 in COS-1 cells led to high levels of HA biosynthesis. Northern blot analysis of the mouse embryo showed that Has3 is predominantly expressed at late gestation as a major, approximately 6.0- to 6.5-kb transcript and a minor, approximately 4.0-kb transcript. By PCR screening somatic cell hybrid DNAs and a YAC contig, Spicer et al. (1997) localized the human HAS3 gene to 16q22.1. By interspecific backcross analysis, they mapped the mouse Has3 gene to chromosome 8. Since HAS1 (OMIM Ref. No. 601463), HAS2 (OMIM Ref. No. 601636), and HAS3 are located on different autosomes, Spicer et al. (1997) suggested that the HAS gene family arose comparatively early in vertebrate evolution by sequential duplication of an ancestral HAS gene.

[6704] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6705] Spicer, A. P.; Olson, J. S.; McDonald, J. A. : Molecular cloning and characterization of a cDNA encoding the third putative mammalian hyaluronan synthase. J. Biol. Chem. 272: 8957-8961, 1997. ; and

[6706] Spicer, A. P.; Seldin, M. F.; Olsen, A. S.; Brown, N.; Wells,

D. E.; Doggett, N. A.; Itano, N.; Kimata, K.; Inazawa, J.; McDonald, J. A. : Chromosomal localization of the human and mouse.

[6707] Further studies establishing the function and utilities of HAS3 are found in John Hopkins OMIM database record ID 602428, and in cited publications numbered 2011 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-jun Sarcoma Virus 17 Oncogene Homolog (avian) (JUN, Accession NM_002228) is another VGAM224 host target gene. JUN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JUN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JUN BINDING SITE, designated SEQ ID:914, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6708] Another function of VGAM224 is therefore inhibition of V-jun Sarcoma Virus 17 Oncogene Homolog (avian) (JUN, Accession NM_002228), a gene which binds and recognizes the enhancer DNA sequence ctga(c/g)tca . Accordingly, utilities of VGAM224 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with JUN. The function of JUN has been established by previous studies. The oncogene JUN is the putative transforming gene of avian sarcoma virus 17; it appears to be derived from a gene of the chicken genome and has homologs in several other vertebrate species. (The name JUN comes from the Japanese 'ju-nana,' meaning the number 17.) JUN was originally thought to be identical to the transcription factor AP1. However, it is now known that AP1 is not a single protein, but constitutes a group of related dimeric basic region-leucine zipper proteins that belong to the JUN, FOS (OMIM Ref. No. 164810), MAF (OMIM Ref. No. 177075), and ATF (see OMIM Ref. No. 603148) sub-families. The various dimers recognize either 12-O-tetradecanoylphorbol-13-acetate (TPA) response elements or cAMP response elements. JUN is the most potent transcriptional activator in its group, and its transcriptional activity is attenuated and sometimes antagonized by JUNB (OMIM Ref. No. 165161). For a review of the structure and function of the AP1 transcription complexes Using a Drosophila model synapse, Sanyal et al. (2002) analyzed cellular functions and regulation of the immediate-early transcription factor AP1, a heterodimer of the

basic leucine zipper proteins FOS and JUN. They observed that AP1 positively regulates synaptic strength and synapse number, thus showing a greater range of influence than CREB (OMIM Ref. No. 123810). Observations from genetic epistasis and RNA quantification experiments indicate that AP1 acts upstream of CREB, regulates levels of CREB mRNA, and functions at the top of the hierarchy of transcription factors known to regulate long-term plasticity. A JUN-kinase signaling module provided a CREB-independent route for neuronal AP1 activation; thus, CREB regulation of AP1 expression may, in some neurons, constitute a positive feedback loop rather than the primary step in AP1 activation. Mathas et al. (2002) found AP1 constitutively activated, with robust JUN and JUNB overexpression, in all cell lines derived from patients with classical Hodgkin lymphoma (OMIM Ref. No. 236000) and anaplastic large cell lymphoma (ALCL), but not in other lymphoma types. AP1 supported proliferation of Hodgkin cells, but suppressed apoptosis of ALCL cells. Mathas et al. (2002) noted that, whereas JUN is upregulated by an autoregulatory process, JUNB is under the control of nuclear factor kappa-B (NFKB; 164011). They found that AP1 and NFKB cooperate and stimulate expres-

sion of the cell cycle regulator cyclin D2 (OMIM Ref. No. 123833), the protooncogene MET (OMIM Ref. No. 164860), and the lymphocyte homing receptor CCR7 (OMIM Ref. No. 600242), which are all strongly expressed in primary Hodgkin/Reed–Sternberg (HRS) cells.

[6709] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6710] Sanyal, S.; Sandstrom, D. J.; Hoeffler, C. A.; Ramaswami, M. : AP–1 function upstream of CREB to control synaptic plasticity in Drosophila. *Nature* 416: 870–874, 2002. ; and

[6711] Mathas, S.; Hinz, M.; Anagnostopoulos, I.; Krappmann, D.; Lietz, A.; Jundt, F.; Bommert, K.; Mehta–Grigoriou, F.; Stein, H.; Dorken, B.; Scheidereit, C. : Aberrantly expressed c–Jun an.

[6712] Further studies establishing the function and utilities of JUN are found in John Hopkins OMIM database record ID 165160, and in cited publications numbered 1119, 1174–118 and 3060–1183 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAD, Mothers Against Decapentaplegic Homolog 9 (Drosophila) (MADH9, Accession NM_005905) is another VGAM224 host target gene. MADH9 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MADH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MADH9 BINDING SITE, designated SEQ ID:1260, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6713] Another function of VGAM224 is therefore inhibition of MAD, Mothers Against Decapentaplegic Homolog 9 (Drosophila) (MADH9, Accession NM_005905). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MADH9. Nuclear Receptor Subfamily 2, Group C, Member 2 (NR2C2, Accession NM_003298) is another VGAM224 host target gene. NR2C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR2C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR2C2 BINDING SITE, designated SEQ ID:1007, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:559.

[6714] Another function of VGAM224 is therefore inhibition of Nuclear Receptor Subfamily 2, Group C, Member 2 (NR2C2, Accession NM_003298), a gene which may regulate gene expression during the late phase of spermatogenesis. Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR2C2. The function of NR2C2 has been established by previous studies. Members of this class of so-called orphan receptors act as ligand-activated transcription factors. The proteins have an N-terminal transactivation domain, a central DNA-binding domain with 2 zinc fingers and a ligand-binding domain at the C terminus (Yoshikawa et al., 1996). The activated receptor/ligand complex is translocated to the nucleus where it binds to hormone response elements of target genes. Chang et al. (1994) cloned NR2C2, or TR4, a member of the nuclear hormone receptor superfamily, using degenerate PCR on RNA from the supraoptic nucleus of the brain with primers based on the conserved DNA-binding domain of these genes. They isolated TR4 cDNAs from both human and rat libraries. The cDNAs encode a predicted 615-amino acid human protein and a

596-amino acid rat protein that are 98% identical. The TR4 sequence is similar to that of the TR2 orphan receptor (Chang et al., 1994). Together they appear to form a distinct subfamily. Hirose et al. (1994) cloned the TR4 gene (which they designated TAK1) from a human lymphoblastoma cDNA library. They stated that the predicted protein is 596 amino acids long. On SDS-PAGE, TR4 migrated as a 65-kD protein. Using Northern blot analysis, Hirose et al. (1994) found that TR4 is expressed as a 9.4-kb mRNA in many tissues, and as a 2.8-kb mRNA primarily in testis. The 2 transcripts appeared to differ in the length of the 3-prime untranslated region. In mouse and rat testis, TR4 was expressed most abundantly in spermatocytes.

[6715] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6716] Chang, C.; da Silva, S. L.; Ideta, R.; Lee, Y.; Yeh, S.; Burbach, J. P. H. : Human and rat TR4 orphan receptors specify a subclass of the steroid receptor superfamily. *Proc. Nat. Acad. Sci.* 91: 6040–6044, 1994. ; and

[6717] Hirose, T.; Fujimoto, W.; Yamaai, T.; Kim, K. H.; Matsuura, H.; Jetten, A. M. : TAK1: Molecular cloning and characteri-

zation of a new member of the nuclear receptor super-family. Molec. E.

[6718] Further studies establishing the function and utilities of NR2C2 are found in John Hopkins OMIM database record ID 601426, and in cited publications numbered 2086–2089 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. AP1S3 (Accession XM_059421) is another VGAM224 host target gene. AP1S3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1S3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1S3 BINDING SITE, designated SEQ ID:3010, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6719] Another function of VGAM224 is therefore inhibition of AP1S3 (Accession XM_059421). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S3. Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168) is another VGAM224 host target gene. ARHE

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHE BINDING SITE, designated SEQ ID:1190, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6720] Another function of VGAM224 is therefore inhibition of Ras Homolog Gene Family, Member E (ARHE, Accession NM_005168). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHE. FLJ11000 (Accession NM_018295) is another VGAM224 host target gene. FLJ11000 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11000, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11000 BINDING SITE, designated SEQ ID:1812, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6721] Another function of VGAM224 is therefore inhibition of FLJ11000 (Accession NM_018295). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11000. FLJ11996 (Accession NM_024976) is another VGAM224 host target gene. FLJ11996 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ11996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11996 BINDING SITE, designated SEQ ID:2120, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6722] Another function of VGAM224 is therefore inhibition of FLJ11996 (Accession NM_024976). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11996. Growth Arrest and DNA-damage-inducible, Alpha (GADD45A, Accession NM_001924) is another VGAM224 host target gene. GADD45A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GADD45A, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GADD45A BINDING SITE, designated SEQ ID:869, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6723] Another function of VGAM224 is therefore inhibition of Growth Arrest and DNA-damage-inducible, Alpha (GADD45A, Accession NM_001924). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GADD45A. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758) is another VGAM224 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ ID:1244, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6724] Another function of VGAM224 is therefore inhibition of

Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. KIAA0179 (Accession XM_035973) is another VGAM224 host target gene. KIAA0179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0179 BINDING SITE, designated SEQ ID:2704, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6725] Another function of VGAM224 is therefore inhibition of KIAA0179 (Accession XM_035973). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0179. KIAA1831 (Accession XM_033366) is another VGAM224 host target gene. KIAA1831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1831, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1831 BINDING SITE, designated SEQ ID:2667, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6726] Another function of VGAM224 is therefore inhibition of KIAA1831 (Accession XM_033366). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1831. Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117) is another VGAM224 host target gene. KLHL4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL4 BINDING SITE, designated SEQ ID:1880, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6727] Another function of VGAM224 is therefore inhibition of Kelch-like 4 (Drosophila) (KLHL4, Accession NM_019117). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with KLHL4. PANX3 (Accession NM_052959) is another VGAM224 host target gene. PANX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PANX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PANX3 BINDING SITE, designated SEQ ID:2350, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6728] Another function of VGAM224 is therefore inhibition of PANX3 (Accession NM_052959). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PANX3. TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256) is another VGAM224 host target gene. TRAF3 BINDING SITE1 and TRAF3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRAF3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF3 BINDING SITE1 and TRAF3 BINDING SITE2, designated SEQ ID:2541 and SEQ ID:1008

respectively, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6729] Another function of VGAM224 is therefore inhibition of TNF Receptor-associated Factor 3 (TRAF3, Accession XM_007256). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF3. ZID (Accession NM_006626) is another VGAM224 host target gene. ZID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZID BINDING SITE, designated SEQ ID:1315, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6730] Another function of VGAM224 is therefore inhibition of ZID (Accession NM_006626). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZID. LOC151742 (Accession NM_139245) is another VGAM224 host target gene. LOC151742 BINDING SITE is HOST TAR-

GET binding site found in the 5' untranslated region of mRNA encoded by LOC151742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151742 BINDING SITE, designated SEQ ID:2477, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6731] Another function of VGAM224 is therefore inhibition of LOC151742 (Accession NM_139245). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151742. LOC152179 (Accession XM_098170) is another VGAM224 host target gene. LOC152179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152179, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152179 BINDING SITE, designated SEQ ID:3352, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6732] Another function of VGAM224 is therefore inhibition of

LOC152179 (Accession XM_098170). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152179. LOC51266 (Accession NM_016509) is another VGAM224 host target gene. LOC51266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51266 BINDING SITE, designated SEQ ID:1691, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6733] Another function of VGAM224 is therefore inhibition of LOC51266 (Accession NM_016509). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51266. LOC90317 (Accession XM_030892) is another VGAM224 host target gene. LOC90317 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90317, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC90317 BINDING SITE, designated SEQ ID:2629, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6734] Another function of VGAM224 is therefore inhibition of LOC90317 (Accession XM_030892). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90317. LOC90470 (Accession XM_031975) is another VGAM224 host target gene. LOC90470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90470 BINDING SITE, designated SEQ ID:2645, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6735] Another function of VGAM224 is therefore inhibition of LOC90470 (Accession XM_031975). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90470. LOC90786 (Accession XM_034127) is another

VGAM224 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:2678, to the nucleotide sequence of VGAM224 RNA, herein designated VGAM RNA, also designated SEQ ID:559.

[6736] Another function of VGAM224 is therefore inhibition of LOC90786 (Accession XM_034127). Accordingly, utilities of VGAM224 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 225 (VGAM225) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6737] VGAM225 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM225 was detected is described

hereinabove with reference to Figs. 1–8.

[6738] VGAM225 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6739] VGAM225 gene encodes a VGAM225 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM225 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM225 precursor RNA is designated SEQ ID:211, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:211 is located at position 118961 relative to the genome of Vaccinia Virus.

[6740] VGAM225 precursor RNA folds onto itself, forming VGAM225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6741] An enzyme complex designated DICER COMPLEX, `dices` the VGAM225 folded precursor RNA into VGAM225 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM225 RNA is designated SEQ ID:560, and is provided hereinbelow with reference to the sequence listing part.

[6742] VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM225 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6743] VGAM225 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM225 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM225 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM225 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6744] The complementary binding of VGAM225 RNA, herein designated VGAM RNA, to host target binding sites on VGAM225 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM225 host target RNA into VGAM225 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6745] It is appreciated that VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM225 host target genes. The mRNA of each one of this plurality of VGAM225 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM225 RNA, herein designated VGAM RNA, and which when bound by VGAM225 RNA causes inhibition of translation of respective one or more VGAM225 host target proteins.

[6746] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM225 gene, herein designated VGAM GENE, on one or more VGAM225 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6747] It is yet further appreciated that a function of VGAM225 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM225 correlate with, and may be deduced from, the identity of the host target genes which VGAM225 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6748] Nucleotide sequences of the VGAM225 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM225 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM225 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM225 are further described hereinbelow with reference to Table 1.

[6749] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM225 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM225 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6750] As mentioned hereinabove with reference to Fig. 1, a function of VGAM225 gene, herein designated VGAM is inhibition of expression of VGAM225 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM225 correlate with, and may be deduced from, the identity of the target genes which VGAM225 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6751] Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM_000489) is a VGAM225 host target gene. ATRX BINDING SITE1 and ATRX BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by ATRX, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRX BINDING SITE1 and ATRX BINDING SITE2, designated SEQ ID:751 and SEQ ID:2431 respectively, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:560.

[6752] A function of VGAM225 is therefore inhibition of Alpha Thalassemia/mental Retardation Syndrome X-linked (RAD54 homolog, *S. cerevisiae*) (ATRX, Accession NM_000489). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRX. RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580) is another VGAM225 host target gene. RAB27A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB27A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB27A BINDING SITE, designated SEQ ID:1128, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM

RNA, also designated SEQ ID:560.

[6753] Another function of VGAM225 is therefore inhibition of RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB27A. Cyldromatosis (turban tumor syndrome) (CYLD, Accession NM_015247) is another VGAM225 host target gene. CYLD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLD BINDING SITE, designated SEQ ID:1616, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:560.

[6754] Another function of VGAM225 is therefore inhibition of Cyldromatosis (turban tumor syndrome) (CYLD, Accession NM_015247). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLD. LOC145945 (Accession XM_096908) is another VGAM225 host target gene. LOC145945 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by LOC145945, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145945 BINDING SITE, designated SEQ ID:3279, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:560.

[6755] Another function of VGAM225 is therefore inhibition of LOC145945 (Accession XM_096908). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145945. LOC200273 (Accession XM_047698) is another VGAM225 host target gene. LOC200273 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200273 BINDING SITE, designated SEQ ID:2895, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:560.

[6756] Another function of VGAM225 is therefore inhibition of

LOC200273 (Accession XM_047698). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200273. LOC220758 (Accession XM_165466) is another VGAM225 host target gene. LOC220758 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220758 BINDING SITE, designated SEQ ID:3497, to the nucleotide sequence of VGAM225 RNA, herein designated VGAM RNA, also designated SEQ ID:560.

[6757] Another function of VGAM225 is therefore inhibition of LOC220758 (Accession XM_165466). Accordingly, utilities of VGAM225 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220758. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 226 (VGAM226) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[6758] VGAM226 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM226 was detected is described hereinabove with reference to Figs. 1–8.

[6759] VGAM226 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6760] VGAM226 gene encodes a VGAM226 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM226 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM226 precursor RNA is designated SEQ ID:212, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:212 is located at position 118120 relative to the genome of Vaccinia Virus.

[6761] VGAM226 precursor RNA folds onto itself, forming VGAM226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6762] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM226 folded precursor RNA into VGAM226 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 74%) nucleotide se-
quence of VGAM226 RNA is designated SEQ ID:561, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6763] VGAM226 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM226 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM226 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6764] VGAM226 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM226 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM226 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[6765] The complementary binding of VGAM226 RNA, herein designated VGAM RNA, to host target binding sites on VGAM226 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM226 host target RNA into VGAM226 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6766] It is appreciated that VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM226 host target genes. The mRNA of each one of this plurality of VGAM226 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM226 RNA, herein designated VGAM RNA, and which when bound by VGAM226 RNA causes inhibition of translation of respective one or more VGAM226 host target proteins.

[6767] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM226 gene, herein designated VGAM GENE, on one or

more VGAM226 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6768] It is yet further appreciated that a function of VGAM226 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM226 correlate with, and may be deduced from, the identity of the host target genes which VGAM226 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [6769] Nucleotide sequences of the VGAM226 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM226 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM226 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM226 are further described hereinbelow with reference to Table 1.
- [6770] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM226 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM226 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6771] As mentioned hereinabove with reference to Fig. 1, a function of VGAM226 gene, herein designated VGAM is inhibition of expression of VGAM226 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM226 correlate with, and may be deduced from, the identity of the target genes which VGAM226 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [6772] Kinesin-like 1 (KNSL1, Accession NM_004523) is a

VGAM226 host target gene. KNSL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL1 BINDING SITE, designated SEQ ID:1123, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6773] A function of VGAM226 is therefore inhibition of Kinesin-like 1 (KNSL1, Accession NM_004523), a gene which is a motor protein required for establishing a bipolar spindle. Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL1. The function of KNSL1 has been established by previous studies. Kinesins are tubulin (see OMIM Ref. No. 191130) molecular motors that function to transport organelles within cells and to move chromosomes along microtubules during cell division. In sea urchin and mammalian cells, kinesins have been characterized as tetrameric proteins comprising 2 heavy chains (alpha chains) of approximately 120 kD and 2 light chains (beta chains) of approximately 70 kD. The alpha chains

provide the tubulin binding site and the ATPase domains, whereas the beta chains are responsible for the specific attachment of the organelle to be moved by the kinesin tetramer. Kinesins transport their bound organelle to the plus end of the microtubule. Chernajovsky et al., (1996) noted that differential splicing occurs for the kinesin beta (light) cDNA sequences at the 3-prime end of the rat kinesin mRNA, producing kinesins having different C-terminal ends that seem to confer the kinesin specificity for organelle binding. Cabeza-Arvelaiz et al. (1993) isolated and sequenced a cDNA encoding the human kinesin light chain protein (KLC). The cDNA consists of 276 nucleotides of 5-prime untranslated region, a coding sequence of 1,710 nucleotides, and 322 nucleotides of 3-prime untranslated region. It encodes a polypeptide of 569 amino acids and a deduced molecular mass of 64,789 daltons. The predicted secondary internal structure of the KLC molecule consists of about 27 contiguous repeats, each of approximately 21 amino acids, and could be divided into 3 domains. See also 601334 Chernajovsky et al. (1996) characterized the human KNS2 gene product of a differentially spliced, T-cell-derived mRNA and cloned its promoter region. The promoter region transcribes consti-

tutively. In permanently transfected human HeLa and NB100 neuroblastoma cells, a reporter gene containing the promoter and part of the first exon of beta kinesin was 75-fold more active than the HSV-tk promoter. The first exon contains a 5-prime untranslated sequence capable of forming a stable double-hairpin loop, which functions as a translational enhancer. Its deletion decreases the efficiency of in vitro translation of beta kinesin mRNA. Kamal et al. (2000) demonstrated that the axonal transport of APP (OMIM Ref. No. 104760) in neurons is mediated by the direct binding of APP to the kinesin light chain subunit of kinesin-I.

[6774] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6775] Goedert, M.; Marsh, S.; Carter, N. : Localization of the human kinesin light chain gene (KNS2) to chromosome 14q32.3 by fluorescence in situ hybridization. Genomics 32: 173-175, 1996. ; and

[6776] Kamal, A.; Stokin, G. B.; Yang, Z.; Xia, C.; Goldstein, L. S. : Axonal transport of amyloid precursor protein is mediated by direct binding to the kinesin light chain subunit of kinesin-.

[6777] Further studies establishing the function and utilities of KNSL1 are found in John Hopkins OMIM database record ID 148760, and in cited publications numbered 72 and 2790–724 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Placenta-specific 1 (PLAC1, Accession NM_021796) is another VGAM226 host target gene. PLAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAC1 BINDING SITE, designated SEQ ID:1960, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6778] Another function of VGAM226 is therefore inhibition of Placenta-specific 1 (PLAC1, Accession NM_021796). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAC1. Sterol Carrier Protein 2 (SCP2, Accession NM_002979) is another VGAM226 host target gene. SCP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

SCP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCP2 BINDING SITE, designated SEQ ID:977, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6779] Another function of VGAM226 is therefore inhibition of Sterol Carrier Protein 2 (SCP2, Accession NM_002979), a gene which may regulate steroidogenesis. Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCP2. The function of SCP2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. Stromal Interaction Molecule 1 (STIM1, Accession XM_011967) is another VGAM226 host target gene. STIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STIM1 BINDING SITE, designated SEQ ID:2558, to the nucleotide sequence of VGAM226 RNA,

herein designated VGAM RNA, also designated SEQ ID:561.

[6780] Another function of VGAM226 is therefore inhibition of Stromal Interaction Molecule 1 (STIM1, Accession XM_011967), a gene which is very strongly similar to murine Stim1 and may be a transmembrane stromal cell protein. Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STIM1. The function of STIM1 has been established by previous studies. Using sequences identified by database searching with a transcript from human chromosome 11p15.5, Parker et al. (1996) screened placental and fetal liver cDNA libraries and cloned a novel cDNA, STIM1, which they called GOK. The deduced 746-amino acid protein contains a predicted signal peptide and transmembrane helix. Parker et al. (1996) also cloned a partial mouse Stim1 genomic clone and found that the human and mouse proteins share 90% sequence identity. Restriction mapping by pulsed field electrophoresis placed the STIM1 gene 1.7 kb telomeric of the RRM1 gene (OMIM Ref. No. 180410) on 11p15.5 (Parker et al., 1996). Sabbioni et al. (1999) determined that the STIM1 gene contains 12 exons that span more

than 250 kb between the RRM1 and NUP98 (OMIM Ref. No. 601021) genes.

[6781] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6782] Parker, N. J.; Begley, C. G.; Smith, P. J.; Fox, R. M. : Molecular cloning of a novel human gene (D11S4896E) at chromosomal region 11p15.5. Genomics 37: 253–256, 1996. ; and

[6783] Sabbioni, S.; Veronese, A.; Trubia, M.; Taramelli, R.; Barbanti-Brodano, G.; Croce, C. M.; Negrini, M. : Exon structure and promoter identification of STIM1 (alias GOK), a human gene ca.

[6784] Further studies establishing the function and utilities of STIM1 are found in John Hopkins OMIM database record ID 605921, and in cited publications numbered 1496–1497 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cortactin Binding Protein 2 (CORTBP2, Accession NM_033427) is another VGAM226 host target gene. CORTBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CORTBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CORTBP2 BINDING SITE, designated SEQ ID:2334, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6785] Another function of VGAM226 is therefore inhibition of Cortactin Binding Protein 2 (CORTBP2, Accession NM_033427). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CORTBP2. Vesicle-associated Membrane Protein 3 (cellubrevin) (VAMP3, Accession NM_004781) is another VGAM226 host target gene. VAMP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VAMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VAMP3 BINDING SITE, designated SEQ ID:1156, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6786] Another function of VGAM226 is therefore inhibition of Vesicle-associated Membrane Protein 3 (cellubrevin)

(VAMP3, Accession NM_004781). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VAMP3. LOC90148 (Accession XM_029430) is another VGAM226 host target gene. LOC90148 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90148, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90148 BINDING SITE, designated SEQ ID:2603, to the nucleotide sequence of VGAM226 RNA, herein designated VGAM RNA, also designated SEQ ID:561.

[6787] Another function of VGAM226 is therefore inhibition of LOC90148 (Accession XM_029430). Accordingly, utilities of VGAM226 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90148. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 227 (VGAM227) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[6788] VGAM227 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM227 was detected is described hereinabove with reference to Figs. 1–8.

[6789] VGAM227 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6790] VGAM227 gene encodes a VGAM227 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM227 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM227 precursor RNA is designated SEQ ID:213, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:213 is located at position 118560 relative to the genome of Vaccinia Virus.

[6791] VGAM227 precursor RNA folds onto itself, forming VGAM227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6792] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM227 folded precursor RNA into VGAM227 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 73%) nucleotide se-
quence of VGAM227 RNA is designated SEQ ID:562, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6793] VGAM227 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM227 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM227 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6794] VGAM227 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM227 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM227 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[6795] The complementary binding of VGAM227 RNA, herein designated VGAM RNA, to host target binding sites on VGAM227 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM227 host target RNA into VGAM227 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6796] It is appreciated that VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM227 host target genes. The mRNA of each one of this plurality of VGAM227 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM227 RNA, herein designated VGAM RNA, and which when bound by VGAM227 RNA causes inhibition of translation of respective one or more VGAM227 host target proteins.

[6797] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM227 gene, herein designated VGAM GENE, on one or

more VGAM227 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6798] It is yet further appreciated that a function of VGAM227 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM227 correlate with, and may be deduced from, the identity of the host target genes which VGAM227 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6799] Nucleotide sequences of the VGAM227 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM227 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM227 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM227 are further described hereinbelow with reference to Table 1.

[6800] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM227 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM227 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6801] As mentioned hereinabove with reference to Fig. 1, a function of VGAM227 gene, herein designated VGAM is inhibition of expression of VGAM227 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM227 correlate with, and may be deduced from, the identity of the target genes which VGAM227 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6802] Adenylate Kinase 2 (AK2, Accession NM_013411) is a

VGAM227 host target gene. AK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AK2 BINDING SITE, designated SEQ ID:1449, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6803] A function of VGAM227 is therefore inhibition of Adenylate Kinase 2 (AK2, Accession NM_013411), a gene which essential for maintenance and cell growth. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AK2. The function of AK2 has been established by previous studies. The existence of a second adenylate kinase (EC 2.7.4.3) locus linked to PGM1 and peptidase C, i.e., on chromosome 1, was suggested by cell hybridization studies by Van Cong et al. (1972). The Goss-Harris method of mapping combines features of recombinational study in families and syntenic tests in hybrid cells. As applied to chromosome 1, the method shows that AK2 and UMPK are distal to PGM1 and that the order of the loci is

PGM1: UMPK: (AK2, alpha-FUC): ENO1 (Goss and Harris, 1977). Carritt et al. (1982) presented evidence that AK2 is in 1p34.

[6804] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6805] Goss, S. J.; Harris, H. : Gene transfer by means of cell fusion. II. The mapping of 8 loci on human chromosome 1 by statistical analysis of gene assortment in somatic cell hybrids. J. Cell Sci. 25: 39-57, 1977. ; and

[6806] Carritt, B.; King, J.; Welch, H. M. : Gene order and localization of enzyme loci on the short arm of chromosome 1. Ann. Hum. Genet. 46: 329-335, 1982.

[6807] Further studies establishing the function and utilities of AK2 are found in John Hopkins OMIM database record ID 103020, and in cited publications numbered 188-191 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cartilage Associated Protein (CRTAP, Accession NM_006371) is another VGAM227 host target gene. CRTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAP BINDING SITE, designated SEQ ID:1291, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6808] Another function of VGAM227 is therefore inhibition of Cartilage Associated Protein (CRTAP, Accession NM_006371), a gene which is a novel developmentally regulated chick embryo protein. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAP. The function of CRTAP has been established by previous studies. Castagnola et al. (1997) isolated a mouse *Crtap* cDNA from a subtracted library specific for mRNAs highly expressed in hypertrophic chondrocytes compared to proliferating and early differentiating chondrocytes. Using a mouse *Crtap* clone to screen a human fetal brain cDNA library, Tonachini et al. (1999) identified human CRTAP cDNA clones. Human CRTAP encodes a deduced 401-amino acid protein with a putative signal peptide of 26 amino acids. CRTAP contains 2 potential N-glycosylation signals. CRTAP shares 89% amino acid sequence identity with mouse *Crtap* and 51% identity with

the chick homolog. The mouse and human genes contain a C-terminal region of approximately 120 amino acids not present in the chick protein. Using Northern blot analysis of human tissues, Tonachini et al. (1999) detected 2-kb and 4-kb CRTAP transcripts in brain, heart, kidney, lung, small intestine, and skeletal muscle. In all tissues except brain, the 2-kb transcript was more abundant. Using immunohistochemistry, the authors detected CRTAP expression in articular chondrocytes. In mouse, Morello et al. (1999) detected 3 Crtap transcripts in a range of tissues, including all mouse embryonic cartilages. In chick, Castagnola et al. (1997) detected a single Crtap transcript in a broad range of embryonic tissues with the strongest expression in the developing cartilage. They detected expression in the extracellular matrix of the forming cartilage surrounding the notochord, the developing sclera, the sphenoid and mandibular cartilage, the long bone cartilage, and the developing sternal cartilage.

[6809] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6810] Castagnola, P.; Gennari, M.; Morello, R.; Tonachini, L.; Marin, O.; Gaggero, A.; Cancedda, R. : Cartilage associated

protein (CASP) is a novel developmentally regulated chick embryo protein. J. Cell Sci. 110: 1351–1359, 1997. ; and

[6811] Morello, R.; Tonachini, L.; Monticone, M.; Viggiano, L.; Rocchi, M.; Cancedda, R.; Castagnola, P. : cDNA cloning, characterization and chromosome mapping of Crtap encoding the mouse carti.

[6812] Further studies establishing the function and utilities of CRTAP are found in John Hopkins OMIM database record ID 605497, and in cited publications numbered 1486–1488 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491) is another VGAM227 host target gene. CXorf6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CXorf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXorf6 BINDING SITE, designated SEQ ID:1218, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6813] Another function of VGAM227 is therefore inhibition of

Chromosome X Open Reading Frame 6 (CXorf6, Accession NM_005491). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXorf6. EphB2 (EPHB2, Accession NM_004442) is another VGAM227 host target gene. EPHB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPHB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPHB2 BINDING SITE, designated SEQ ID:1113, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6814] Another function of VGAM227 is therefore inhibition of EphB2 (EPHB2, Accession NM_004442), a gene which Eph-related receptor tyrosine kinase B2; may have a role in neurogenesis. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPHB2. The function of EPHB2 has been established by previous studies. See 179610 for background on Eph receptors and their ligands, the ephrins. Chan and Watt (1991) cloned partial

sequences of the EEK (EPHA8; 176945) and ERK genes encoding members of the EPH subclass of receptor protein-tyrosine kinases. Northern blot analysis of rat RNA showed that DNA encoding human ERK hybridized to transcripts most abundantly in lung. By screening a human fetal brain cDNA expression library using a monoclonal antiphosphotyrosine antibody and by 5-prime RACE (rapid amplification of cDNA ends) procedures, Ikegaki et al. (1995) isolated overlapping cDNAs encoding a receptor-type tyrosine kinase belonging to the EPH family and designated the gene DRT (for developmentally regulated EPH-related tyrosine kinase). The DRT gene is expressed in transcripts of 3 different sizes (4, 5, and 11 kb). The DRT transcripts are expressed in human brain and several other tissues, including heart, lung, kidney, placenta, pancreas, liver, and skeletal muscle, but the 11-kb DRT transcript is preferentially expressed in fetal brain. Steady-state levels of DRT mRNA in several tissues, including brain, heart, lung, and kidney, are greater in the midterm fetus than those in the adult. Ikegaki et al. (1995) showed that a large number of tumor cell lines derived from neuroectoderm express DRT transcripts. The authors speculated that DRT may play a part in human neurogenesis. Using a yeast

2-hybrid system, Cowan et al. (2000) demonstrated that PDZ domain-containing protein Pick1 (PRKCABP; 605926) binds the C-terminal tail of EphB2. Using colocalization studies and biochemical analysis, they demonstrated that a protein complex containing EphB2 and aquaporin-1 (AQP1; 107776) is formed in vivo. They concluded that Ephb2 may regulate ionic homeostasis and endolymph fluid production through macromolecular associations with membrane channels that transport chloride, bicarbonate, and water. Chan and Watt (1991) mapped the EEK and ERK genes to chromosome 1 by Southern blot analysis of somatic cell hybrids. Ikegaki et al. (1995) mapped DRT, the EPHB2 gene, to 1p36.1-p35 by PCR screening of human/rodent somatic cell hybrid panels and by fluorescence in situ hybridization. As the distal end of 1p is often deleted in neuroblastomas, the DRT gene may play a role in neuroblastoma and small cell lung carcinoma (SCLC) tumorigenesis. By fluorescence in situ hybridization, Saito et al. (1995) demonstrated that the ERK gene is located in chromosomal region 1p36.1. They showed that the homologous genes are located on mouse 4D2.2-D3 and rat 5q36.13, both of which are regions with conserved linkage homology to human chromosome 1p. Animal model

experiments lend further support to the function of EPHB2. Halford et al. (2000) generated mice deficient in Ryk (OMIM Ref. No. 600524) and found that they had a distinctive craniofacial appearance, shortened limbs, and postnatal mortality due to feeding and respiratory complications associated with a complete cleft of the secondary palate. Consistent with cleft palate phenocopy in Ephb2/Ephb3 (OMIM Ref. No. 601839)-deficient mice and the role of a Drosophila Ryk ortholog, 'Derailed,' in the transduction of repulsive axon pathfinding cues, biochemical data implicated Ryk in signaling mediated by Eph receptors and cell junction-associated Af6 (OMIM Ref. No. 159559). Halford et al. (2000) concluded that their findings highlighted the importance of signal crosstalk between members of different RTK subfamilies.

[6815] It is appreciated that the abovementioned animal model for EPHB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6816] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6817] Ikegaki, N.; Tang, X. X.; Liu, X.-G.; Biegel, J. A.; Allen, C.;

Yoshioka, A.; Sulman, E. P.; Brodeur, G. M.; Pleasure, D. E. : Molecular characterization and chromosomal localization of DRT (EPHT3): a developmentally regulated human protein-tyrosine kinase gene of the EPH family. Hum. Molec. Genet. 4: 2033-2045, 1995. ; and

[6818] Halford, M. M.; Armes, J.; Buchert, M.; Meskenaite, V.; Grail, D.; Hibbs, M. L.; Wilks, A. F.; Farlie, P. G.; Newgreen, D. F.; Hovens, C. M.; Stacker, S. A. : Ryk-deficient mice exhibit.

[6819] Further studies establishing the function and utilities of EPHB2 are found in John Hopkins OMIM database record ID 600997, and in cited publications numbered 3054, 3052-1773, 1716, 1774, 1792, 1793-1794, 177 and 1795 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Frizzled Homolog 3 (Drosophila) (FZD3, Accession NM_017412) is another VGAM227 host target gene. FZD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FZD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FZD3 BINDING SITE, designated SEQ ID:1717, to the nucleotide se-

quence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6820] Another function of VGAM227 is therefore inhibition of Frizzled Homolog 3 (*Drosophila*) (FZD3, Accession NM_017412), a gene which may play a role in neurogenesis during embryogenesis. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FZD3. The function of FZD3 has been established by previous studies. *Drosophila* cuticle hairs are arranged in a defined polarity that is genetically controlled by 'frizzled,' a 7-transmembrane receptor with a large extracellular N-terminal cysteine-rich domain (CRD). Members of the FZD family are receptors for secreted WNT glycoproteins (see OMIM Ref. No. 602863), which are involved in developmental control. FZD proteins transmit signals through the beta-catenin (CTNNB1; 116806) or JNK (e.g., JNK3; 602897) pathways. The selection of intracellular signaling cascade may be determined by different C-terminal motifs in FZD proteins. Sala et al. (2000) determined that the FZD3 gene maps distal to the NFL gene (OMIM Ref. No. 162280) on 8p21. They mapped the mouse gene to chromosome 14, between the *Gja3* and *Nfl* genes in a region

showing homology of synteny to human 8p21. Sala et al. (2000) noted that the human FZD3 gene is in close proximity to a putative schizophrenia susceptibility locus (SCZD6; 603013) and that WNT signaling is abnormal in some schizophrenic patients. By FISH, Kirikoshi et al. (2000) mapped the FZD3 gene to 8p21, a region associated with loss of heterozygosity in human tumors.

[6821] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6822] Kirikoshi, H.; Koike, J.; Sagara, N.; Saitoh, T.; Tokuhara, M.; Tanaka, K.; Sekihara, H.; Hirai, M.; Katoh, M. : Molecular cloning and genomic structure of human Frizzled-3 at chromosome 8p21. Biochem. Biophys. Res. Commun. 271: 8-14, 2000. ; and

[6823] Sala, C. F.; Formenti, E.; Terstappen, G. C.; Caricasole, A. : Identification, gene structure, and expression of human frizzled-3 (FZD3). Biochem. Biophys. Res. Commun. 273: 27-34, 200.

[6824] Further studies establishing the function and utilities of FZD3 are found in John Hopkins OMIM database record ID 606143, and in cited publications numbered 1503-1504 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483) is another VGAM227 host target gene. HMGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HMGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMGA2 BINDING SITE, designated SEQ ID:1033, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6825] Another function of VGAM227 is therefore inhibition of High Mobility Group AT-hook 2 (HMGA2, Accession NM_003483), a gene which may affect transcription and cell differentiation; shares common DNA-binding motif with other HMG HMG I/Y family members. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HMGA2. The function of HMGA2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM137. Solute Carrier Family 2 (facilitated glucose transporter), Member 4 (SLC2A4, Ac-

cession NM_001042) is another VGAM227 host target gene. SLC2A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A4 BINDING SITE, designated SEQ ID:794, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6826] Another function of VGAM227 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 4 (SLC2A4, Accession NM_001042), a gene which insulin-regulated facilitative glucose transporter. Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A4. The function of SLC2A4 has been established by previous studies. The stimulation of glucose uptake by insulin in muscle and adipose tissue requires translocation of the GLUT4 glucose transporter from intracellular storage sites to the cell surface. Activation of phosphatidylinositol-3-OH kinase (PI3K) is required for this trafficking event, but it is not sufficient to produce

GLUT4 translocation. Ribon et al. (1998) and Baumann et al. (2000) described a pathway involving the insulin-stimulated tyrosine phosphorylation of CBL (OMIM Ref. No. 165360), which is recruited to the insulin receptor (OMIM Ref. No. 147670) by the adaptor protein CAP (OMIM Ref. No. 605264). On phosphorylation, CBL is translocated to lipid rafts. Blocking this step completely inhibits the stimulation of GLUT4 translocation by insulin. Chiang et al. (2001) showed that phosphorylated CBL recruits the CRK2-C3G (164762, 600303) complex to lipid rafts, where C3G specifically activates the small GTP-binding protein TC10 (OMIM Ref. No. 605857). This process is independent of PI3K, but requires the translocation of CBL, CRK, and C3G to the lipid raft. The activation of TC10 is essential for insulin-stimulated glucose uptake and GLUT4 translocation. The TC10 pathway functions in parallel with PI3K to stimulate fully GLUT4 translocation in response to insulin. Animal model experiments lend further support to the function of SLC2A4. To determine the role of adipose GLUT4 in glucose homeostasis, Abel et al. (2001) used Cre/loxP DNA recombination to generate mice with adipose-selective reduction of GLUT4 (G4A^{-/-}). G4A^{-/-} mice had normal growth and adipose mass

despite markedly impaired insulin-stimulated glucose uptake in adipocytes. Although GLUT4 expression is preserved in muscle, these mice developed insulin resistance in muscle and liver, manifested by decreased biologic responses and impaired activation of phosphoinositide-3-OH kinase (see OMIM Ref. No. 601232). G4A $-/-$ mice developed glucose intolerance and hyperinsulinemia. Thus, downregulation of GLUT4 and glucose transport selectively in adipose tissue can cause insulin resistance and thereby increase the risk of developing diabetes. In G4A $-/-$ mice, mean plasma leptin levels were normal and plasma leptin concentrations showed the same linear relationship with body weight in G4A $-/-$ mice as in control littermates. Thus, normal glucose uptake in adipocytes is not necessary to maintain normal plasma leptin levels. Elevated TNF- α (OMIM Ref. No. 191160) was noted in G4A $-/-$ mice.

[6827] It is appreciated that the abovementioned animal model for SLC2A4 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6828] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [6829] Abel, E. D.; Peroni, O.; Kim, J. K.; Kim, Y.-B.; Boss, O.; Hadro, E.; Minnemann, T.; Shulman, G. I.; Kahn, B. B. : Adipose-selective targeting of the GLUT4 gene impairs insulin action in muscle and liver. *Nature* 409: 729–733, 2001. ; and
- [6830] Chiang, S.-H.; Baumann, C. A.; Kanzaki, M.; Thurmond, D. C.; Watson, R. T.; Neudauer, C. L.; Macara, I. G.; Pessin, J. E.; Saltiel, A. R. : Insulin-stimulated GLUT4 translocation requires.
- [6831] Further studies establishing the function and utilities of SLC2A4 are found in John Hopkins OMIM database record ID 138190, and in cited publications numbered 2775–2776, 2633, 2777–2780, 275 and 2781–2787 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class V, Type 10B (ATP10B, Accession XM_032721) is another VGAM227 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING

SITE, designated SEQ ID:2654, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6832] Another function of VGAM227 is therefore inhibition of ATPase, Class V, Type 10B (ATP10B, Accession XM_032721). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM_078469) is another VGAM227 host target gene. BCCIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCCIP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCCIP BINDING SITE, designated SEQ ID:2369, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6833] Another function of VGAM227 is therefore inhibition of BRCA2 and CDKN1A Interacting Protein (BCCIP, Accession NM_078469). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCCIP. Chromosome 20

Open Reading Frame 30 (C20orf30, Accession NM_014145) is another VGAM227 host target gene. C20orf30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C20orf30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf30 BINDING SITE, designated SEQ ID:1478, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6834] Another function of VGAM227 is therefore inhibition of Chromosome 20 Open Reading Frame 30 (C20orf30, Accession NM_014145). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf30. DKFZP564O043 (Accession XM_166502) is another VGAM227 host target gene. DKFZP564O043 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DK-

FZP564O043 BINDING SITE, designated SEQ ID:3565, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6835] Another function of VGAM227 is therefore inhibition of DKFZP564O043 (Accession XM_166502). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O043. FLJ11710 (Accession NM_024846) is another VGAM227 host target gene. FLJ11710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11710 BINDING SITE, designated SEQ ID:2097, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6836] Another function of VGAM227 is therefore inhibition of FLJ11710 (Accession NM_024846). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11710. JDD1 (Accession XM_032515) is another VGAM227 host target gene. JDD1 BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by JDD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JDD1 BINDING SITE, designated SEQ ID:2653, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6837] Another function of VGAM227 is therefore inhibition of JDD1 (Accession XM_032515). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with JDD1. KIAA0265 (Accession XM_045954) is another VGAM227 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:2871, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6838] Another function of VGAM227 is therefore inhibition of KIAA0265 (Accession XM_045954). Accordingly, utilities

of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0265. KIAA0663 (Accession NM_014827) is another VGAM227 host target gene. KIAA0663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:1561, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6839] Another function of VGAM227 is therefore inhibition of KIAA0663 (Accession NM_014827). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA1010 (Accession XM_050742) is another VGAM227 host target gene. KIAA1010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1010 BINDING SITE, designated SEQ ID:2934, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6840] Another function of VGAM227 is therefore inhibition of KIAA1010 (Accession XM_050742). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1010. KIAA1576 (Accession XM_038186) is another VGAM227 host target gene. KIAA1576 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1576 BINDING SITE, designated SEQ ID:2734, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6841] Another function of VGAM227 is therefore inhibition of KIAA1576 (Accession XM_038186). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1576. KIAA1634 (Accession XM_032749) is another VGAM227 host target gene. KIAA1634 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:2658, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6842] Another function of VGAM227 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1798 (Accession XM_027074) is another VGAM227 host target gene. KIAA1798 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1798 BINDING SITE, designated SEQ ID:2575, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6843] Another function of VGAM227 is therefore inhibition of

KIAA1798 (Accession XM_027074). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1798. Kinesin-like 7 (KNSL7, Accession NM_020242) is another VGAM227 host target gene. KNSL7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL7 BINDING SITE, designated SEQ ID:1904, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6844] Another function of VGAM227 is therefore inhibition of Kinesin-like 7 (KNSL7, Accession NM_020242). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL7. LALP1 (Accession NM_020354) is another VGAM227 host target gene. LALP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LALP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of LALP1 BINDING SITE, designated SEQ ID:1916, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6845] Another function of VGAM227 is therefore inhibition of LALP1 (Accession NM_020354). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LALP1. MGC2488 (Accession NM_024039) is another VGAM227 host target gene. MGC2488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2488 BINDING SITE, designated SEQ ID:2044, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6846] Another function of VGAM227 is therefore inhibition of MGC2488 (Accession NM_024039). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2488. nexilin (Accession NM_144573) is another

VGAM227 host target gene. nexilin BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by nexilin, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of nexilin BINDING SITE, designated SEQ ID:2484, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6847] Another function of VGAM227 is therefore inhibition of nexilin (Accession NM_144573). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with nexilin. NKX2B (Accession NM_002509) is another VGAM227 host target gene. NKX2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NKX2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NKX2B BINDING SITE, designated SEQ ID:934, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6848] Another function of VGAM227 is therefore inhibition of NKX2B (Accession NM_002509). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NKX2B. Syntaxin 18 (STX18, Accession NM_016930) is another VGAM227 host target gene. STX18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX18 BINDING SITE, designated SEQ ID:1715, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6849] Another function of VGAM227 is therefore inhibition of Syntaxin 18 (STX18, Accession NM_016930). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX18. Zinc Finger Protein 271 (ZNF271, Accession XM_170865) is another VGAM227 host target gene. ZNF271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF271, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF271 BINDING SITE, designated SEQ ID:3670, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6850] Another function of VGAM227 is therefore inhibition of Zinc Finger Protein 271 (ZNF271, Accession XM_170865). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF271. LOC115207 (Accession NM_138444) is another VGAM227 host target gene. LOC115207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115207 BINDING SITE, designated SEQ ID:2440, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6851] Another function of VGAM227 is therefore inhibition of LOC115207 (Accession NM_138444). Accordingly, utilities

of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115207. LOC133482 (Accession XM_059654) is another VGAM227 host target gene. LOC133482 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC133482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC133482 BINDING SITE, designated SEQ ID:3014, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6852] Another function of VGAM227 is therefore inhibition of LOC133482 (Accession XM_059654). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC133482. LOC147080 (Accession XM_097182) is another VGAM227 host target gene. LOC147080 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147080, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC147080 BINDING SITE, designated SEQ ID:3290, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6853] Another function of VGAM227 is therefore inhibition of LOC147080 (Accession XM_097182). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147080. LOC147990 (Accession XM_097358) is another VGAM227 host target gene. LOC147990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147990 BINDING SITE, designated SEQ ID:3295, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6854] Another function of VGAM227 is therefore inhibition of LOC147990 (Accession XM_097358). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147990. LOC149529 (Accession XM_086562) is another VGAM227 host target gene. LOC149529 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC149529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149529 BINDING SITE, designated SEQ ID:3134, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6855] Another function of VGAM227 is therefore inhibition of LOC149529 (Accession XM_086562). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149529. LOC158130 (Accession XM_044880) is another VGAM227 host target gene. LOC158130 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158130, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158130 BINDING SITE, designated SEQ ID:2847, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6856] Another function of VGAM227 is therefore inhibition of

LOC158130 (Accession XM_044880). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158130. LOC196478 (Accession XM_113729) is another VGAM227 host target gene. LOC196478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196478 BINDING SITE, designated SEQ ID:3413, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6857] Another function of VGAM227 is therefore inhibition of LOC196478 (Accession XM_113729). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196478. LOC219894 (Accession XM_167782) is another VGAM227 host target gene. LOC219894 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219894, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC219894 BINDING SITE, designated SEQ ID:3595, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6858] Another function of VGAM227 is therefore inhibition of LOC219894 (Accession XM_167782). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219894. LOC219988 (Accession XM_166223) is another VGAM227 host target gene. LOC219988 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219988 BINDING SITE, designated SEQ ID:3535, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6859] Another function of VGAM227 is therefore inhibition of LOC219988 (Accession XM_166223). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219988. LOC221272 (Accession XM_168050) is an-

other VGAM227 host target gene. LOC221272 BINDING SITE1 and LOC221272 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC221272, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221272 BINDING SITE1 and LOC221272 BINDING SITE2, designated SEQ ID:3613 and SEQ ID:3614 respectively, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6860] Another function of VGAM227 is therefore inhibition of LOC221272 (Accession XM_168050). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221272. LOC253019 (Accession XM_170907) is another VGAM227 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253019 BINDING SITE, designated SEQ ID:3673, to

the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6861] Another function of VGAM227 is therefore inhibition of LOC253019 (Accession XM_170907). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253975 (Accession XM_171130) is another VGAM227 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:3687, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6862] Another function of VGAM227 is therefore inhibition of LOC253975 (Accession XM_171130). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. LOC254873 (Accession XM_170557) is another VGAM227 host target gene. LOC254873 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC254873, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254873 BINDING SITE, designated SEQ ID:3659, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6863] Another function of VGAM227 is therefore inhibition of LOC254873 (Accession XM_170557). Accordingly, utilities of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254873. LOC51634 (Accession NM_016024) is another VGAM227 host target gene. LOC51634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51634 BINDING SITE, designated SEQ ID:1655, to the nucleotide sequence of VGAM227 RNA, herein designated VGAM RNA, also designated SEQ ID:562.

[6864] Another function of VGAM227 is therefore inhibition of LOC51634 (Accession NM_016024). Accordingly, utilities

of VGAM227 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51634. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 228 (VGAM228) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6865] VGAM228 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM228 was detected is described hereinabove with reference to Figs. 1–8.

[6866] VGAM228 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6867] VGAM228 gene encodes a VGAM228 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM228 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM228 precursor RNA is designated SEQ ID:214, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:214 is located at position 120881 relative to the genome of Vaccinia Virus.

[6868] VGAM228 precursor RNA folds onto itself, forming VGAM228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6869] An enzyme complex designated DICER COMPLEX, `dices` the VGAM228 folded precursor RNA into VGAM228 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM228 RNA is designated SEQ ID:563, and is

provided hereinbelow with reference to the sequence listing part.

[6870] VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM228 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[6871] VGAM228 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM228 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM228 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6872] The complementary binding of VGAM228 RNA, herein designated VGAM RNA, to host target binding sites on VGAM228 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM228 host target RNA into VGAM228 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6873] It is appreciated that VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM228 host target genes. The mRNA of each one of this plurality of VGAM228 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM228 RNA, herein designated VGAM RNA, and which when bound by VGAM228 RNA causes inhibition of translation of respective one or more VGAM228 host target proteins.

[6874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM228 gene, herein designated VGAM GENE, on one or more VGAM228 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6875] It is yet further appreciated that a function of VGAM228 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM228 correlate with, and may be deduced from, the identity of the host target genes which VGAM228 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6876] Nucleotide sequences of the VGAM228 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM228 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM228 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM228 are further described hereinbelow with reference to Table 1.

[6877] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM228 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM228 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6878] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM228 gene, herein designated VGAM is inhibition of expression of VGAM228 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM228 correlate with, and may be deduced from, the identity of the target genes which VGAM228 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6879] ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555) is a VGAM228 host target gene. ABCE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ABCE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCE1 BINDING SITE, designated SEQ ID:2532, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:563.

[6880] A function of VGAM228 is therefore inhibition of ATP-binding Cassette, Sub-family E (OABP), Member 1 (ABCE1, Accession XM_003555), a gene which a Ribonuclease L inhibitor. Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with ABCE1. The function of ABCE1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM172.WWP1 (Accession NM_007013) is another VGAM228 host target gene. WWP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WWP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WWP1 BINDING SITE, designated SEQ ID:1345, to the nucleotide sequence of VGAM228 RNA, herein designated VGAM RNA, also designated SEQ ID:563.

[6881] Another function of VGAM228 is therefore inhibition of WWP1 (Accession NM_007013). Accordingly, utilities of VGAM228 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WWP1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 229 (VGAM229) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[6882] VGAM229 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM229 was detected is described hereinabove with reference to Figs. 1–8.

[6883] VGAM229 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6884] VGAM229 gene encodes a VGAM229 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM229 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM229 precursor RNA is designated SEQ ID:215, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:215 is located at position 122419 relative to the genome of Vaccinia Virus.

[6885] VGAM229 precursor RNA folds onto itself, forming VGAM229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6886] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM229 folded precursor RNA into VGAM229 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 90%) nucleotide se-
quence of VGAM229 RNA is designated SEQ ID:564, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6887] VGAM229 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM229 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM229 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[6888] VGAM229 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM229 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM229 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[6889] The complementary binding of VGAM229 RNA, herein designated VGAM RNA, to host target binding sites on VGAM229 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM229 host target RNA into VGAM229 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6890] It is appreciated that VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM229 host target genes. The mRNA of each one of this plurality of VGAM229 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM229 RNA, herein designated VGAM RNA, and which when bound by VGAM229 RNA causes inhibition of translation of respective one or more VGAM229 host target proteins.

[6891] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM229 gene, herein designated VGAM GENE, on one or

more VGAM229 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6892] It is yet further appreciated that a function of VGAM229 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM229 correlate with, and may be deduced from, the identity of the host target genes which VGAM229 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [6893] Nucleotide sequences of the VGAM229 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM229 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM229 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM229 are further described hereinbelow with reference to Table 1.
- [6894] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM229 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM229 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6895] As mentioned hereinabove with reference to Fig. 1, a function of VGAM229 gene, herein designated VGAM is inhibition of expression of VGAM229 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM229 correlate with, and may be deduced from, the identity of the target genes which VGAM229 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [6896] Growth Differentiation Factor 8 (GDF8, Accession

NM_005259) is a VGAM229 host target gene. GDF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDF8 BINDING SITE, designated SEQ ID:1197, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6897] A function of VGAM229 is therefore inhibition of Growth Differentiation Factor 8 (GDF8, Accession NM_005259), a gene which acts specifically as a negative regulator of skeletal muscle growth. Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDF8. The function of GDF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM213. Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793) is another VGAM229 host target gene. DIO2 BINDING SITE1 and DIO2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DIO2, corresponding to HOST TAR-

GET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIO2 BINDING SITE1 and DIO2 BINDING SITE2, designated SEQ ID:773 and SEQ ID:1454 respectively, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6898] Another function of VGAM229 is therefore inhibition of Deiodinase, Iodothyronine, Type II (DIO2, Accession NM_000793). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIO2. KIAA0478 (Accession NM_014870) is another VGAM229 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:1573, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6899] Another function of VGAM229 is therefore inhibition of

KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0478. KIAA0513 (Accession NM_014732) is another VGAM229 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:1535, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6900] Another function of VGAM229 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA1323 (Accession XM_032146) is another VGAM229 host target gene. KIAA1323 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1323, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1323 BINDING SITE, designated SEQ ID:2647, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6901] Another function of VGAM229 is therefore inhibition of KIAA1323 (Accession XM_032146). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1323. P450RAI-2 (Accession NM_019885) is another VGAM229 host target gene. P450RAI-2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P450RAI-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P450RAI-2 BINDING SITE, designated SEQ ID:1888, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6902] Another function of VGAM229 is therefore inhibition of P450RAI-2 (Accession NM_019885). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P450RAI-2. Xylosyltransferase I (XYLT1, Accession

XM_085432) is another VGAM229 host target gene. XYLT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XYLT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XYLT1 BINDING SITE, designated SEQ ID:3089, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6903] Another function of VGAM229 is therefore inhibition of Xylosyltransferase I (XYLT1, Accession XM_085432). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XYLT1. LOC143282 (Accession XM_084481) is another VGAM229 host target gene. LOC143282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143282 BINDING SITE, designated SEQ ID:3055, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6904] Another function of VGAM229 is therefore inhibition of LOC143282 (Accession XM_084481). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143282. LOC200132 (Accession XM_114126) is another VGAM229 host target gene. LOC200132 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200132, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200132 BINDING SITE, designated SEQ ID:3438, to the nucleotide sequence of VGAM229 RNA, herein designated VGAM RNA, also designated SEQ ID:564.

[6905] Another function of VGAM229 is therefore inhibition of LOC200132 (Accession XM_114126). Accordingly, utilities of VGAM229 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200132. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 230 (VGAM230) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[6906] VGAM230 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM230 was detected is described hereinabove with reference to Figs. 1–8.

[6907] VGAM230 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6908] VGAM230 gene encodes a VGAM230 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM230 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM230 precursor RNA is designated SEQ ID:216, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:216 is located at position 125121 relative to the genome of Vaccinia Virus.

[6909] VGAM230 precursor RNA folds onto itself, forming VGAM230 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[6910] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM230 folded precursor RNA into VGAM230 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 78%) nucleotide se-
quence of VGAM230 RNA is designated SEQ ID:565, and is
provided hereinbelow with reference to the sequence list-
ing part.

[6911] VGAM230 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM230 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM230 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6912] VGAM230 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM230 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM230 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6913] The complementary binding of VGAM230 RNA, herein designated VGAM RNA, to host target binding sites on VGAM230 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM230 host target RNA into VGAM230 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6914] It is appreciated that VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM230 host target genes. The mRNA of each one of this plurality of VGAM230 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM230 RNA, herein designated VGAM RNA, and which when bound by VGAM230 RNA causes inhibition of translation of respective one or more VGAM230 host target proteins.

[6915] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM230 gene, herein designated VGAM GENE, on one or more VGAM230 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6916] It is yet further appreciated that a function of VGAM230 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM230 correlate with, and may be deduced from, the identity of the host target genes which VGAM230 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [6917] Nucleotide sequences of the VGAM230 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM230 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM230 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM230 are further described hereinbelow with reference to Table 1.
- [6918] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM230 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM230 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [6919] As mentioned hereinabove with reference to Fig. 1, a function of VGAM230 gene, herein designated VGAM is inhibition of expression of VGAM230 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM230 correlate with, and may be deduced from, the identity of the target genes which VGAM230 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6920] Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_000604) is a VGAM230 host target gene. FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR1 BINDING SITE1 through FGFR1 BINDING SITE6, designated SEQ ID:759, SEQ ID:1647, SEQ ID:2031, SEQ ID:2033, SEQ ID:2035 and SEQ ID:2036 respectively, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6921] A function of VGAM230 is therefore inhibition of Fibroblast Growth Factor Receptor 1 (fms-related tyrosine kinase 2, Pfeiffer syndrome) (FGFR1, Accession NM_000604). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR1. Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594) is another VGAM230 host target gene. PCSK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by PCSK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCSK2 BINDING SITE, designated SEQ ID:940, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6922] Another function of VGAM230 is therefore inhibition of Proprotein Convertase Subtilisin/kexin Type 2 (PCSK2, Accession NM_002594), a gene which is involved in the processing of hormone and other protein precursors at sites comprised of pairs of basic amino acid residues. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCSK2. The function of PCSK2 has been established by previous studies. Ohagi et al. (1992) observed expression of the chloramphenicol acetyltransferase reporter fusions containing the putative promoter region in insulinoma cells but not in hepatoma cells, consistent with the known tissue-specific pattern of expression of the PC2 gene. Analysis of the level of CAT activity with several deletion mutants identified the region from -1100 to -539 from the translation start site as essential for PC2

promoter activity. During secretion, immature 75-kD proPC2 is cleaved to produce active 68-kD PC2 protein. Taylor et al. (1997) examined the secretion of the proPC2 peptide from COS cells. They found that cleavage was not necessary for PC2 secretion. However, proper folding of the protein was necessary for secretion, and sequences at the C-terminus appeared to stabilize the correct conformation of the protein. Animal model experiments lend further support to the function of PCSK2. Homozygous Pc2-null mice grow normally and are generally healthy but have altered carbohydrate metabolism characterized by mild hypoglycemia and flattened glucose-tolerance curves (Furuta et al., 1997). They also show impaired processing of insulin, glucagon, and somatostatin (Furuta et al., 1998). Furuta et al. (2001) examined the biosynthesis and processing of proglucagon in isolated islets from these mice via pulse-chase labeling and found that proglucagon undergoes essentially no processing in chase periods up to 8 hours. Ultrastructural and immunocytochemical studies indicated the presence of large amounts of proglucagon in atypical-appearing secretory granules in the hyperplastic and hypertrophic A-cells, along with morphological evidence of high rates of proglucagon se-

cretion in Pc2-null mice.

[6923] It is appreciated that the abovementioned animal model for PCSK2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[6924] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6925] Furuta, M.; Zhou, A.; Webb, G.; Carroll, R.; Ravazzola, M.; Orci, L.; Steiner, D. F. : Severe defect in proglucagon processing in islet A-cells of prohormone convertase 2 null mice. J. Biol. Chem. 276: 27197-27202, 2001. ; and

[6926] Furuta, M.; Carroll, R.; Martin, S.; Swift, H.; Ravazzola, M.; Orci, L.; Steiner, D. : Incomplete processing of proinsulin to insulin accompanied by elevation of Des-31,32 proinsulin in.

[6927] Further studies establishing the function and utilities of PCSK2 are found in John Hopkins OMIM database record ID 162151, and in cited publications numbered 844-416, 420-41 and 846 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Serine/threonine Kinase 24 (STE20 homolog, yeast) (STK24, Accession NM_003576) is another VGAM230 host

target gene. STK24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK24 BINDING SITE, designated SEQ ID:1038, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6928] Another function of VGAM230 is therefore inhibition of Serine/threonine Kinase 24 (STE20 homolog, yeast) (STK24, Accession NM_003576), a gene which acts on both serine and threonine residues. Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK24. The function of STK24 has been established by previous studies. Using PCR with degenerate primers based on conserved regions of the kinase domains of STE20 and p65PAK, Schinkmann and Blenis (1997) obtained a fragment from a HeLa cell cDNA library. By screening T cell and HeLa cell cDNA libraries using the fragment as the probe, they isolated a cDNA encoding STK24, which they termed MST3. Sequence analysis showed that the pre-

dicted 431-amino acid STK24 protein contains an N-terminal kinase domain and a C-terminal regulatory domain. STK24 shares 69% amino acid identity with STK25 (OMIM Ref. No. 602255) and is a member of the GCK subfamily of STE20-like proteins. Northern blot analysis revealed ubiquitous expression of a 2.0-kb STK24 transcript, with highest levels detected in heart, skeletal muscle, and pancreas. Western blot analysis detected a 52-kD STK24 protein in all cell lines tested. In vitro kinase assays demonstrated that STK24 readily phosphorylates MBP (OMIM Ref. No. 159430), histone H3, and itself but not histones H1, H2, and H4 (see OMIM Ref. No. 142711), casein (see OMIM Ref. No. 115450), or phosphotyrosine (CSNK2B; 115441); phosphorylation occurs with manganese as the cofactor. Immunofluorescence microscopy showed that STK24 is expressed in the cytoplasm. By searching an EST database using the conserved catalytic domain of STE20 as the probe, Zhou et al. (2000) identified an STK24 isoform that they called MST3B. The sequence of MST3B is identical after nucleotide 223 to the MST3 sequence reported by Schinkmann and Blenis (1997). MST3B encodes a predicted 443-amino acid protein. RT-PCR and Northern blot analyses revealed that expression of the 2.5-kb

MST3B transcript is restricted to brain; Western blot analysis confirmed the brain-specific expression. In situ hybridization analysis showed that MST3B is widely expressed in different brain regions, with high levels in hippocampus, cerebral cortex, and hypothalamus, and moderate levels in geniculate nucleus and thalamic nucleus. Reduced MST3B expression was observed in cerebellum. Functional analyses demonstrated that MST3 but not MST3B phosphorylates and activates p42MAPK (MAPK1; 176948)/p44MAPK (MAPK3; 601795) but not MAPK14 or JNK. Mutational analysis indicated that protein kinase A (see OMIM Ref. No. 176911) phosphorylation of thr18 at the N terminus of MST3B negatively regulates its ability to phosphorylate and activate MAPK3.

[6929] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6930] Schinkmann, K.; Blenis, J. : Cloning and characterization of a human STE20-like protein kinase with unusual cofactor requirements. J. Biol. Chem. 272: 28695–28703, 1997. ; and

[6931] Zhou, T.-H.; Ling, K.; Guo, J.; Zhou, H.; Wu, Y.-L.; Jing, Q.; Ma, L.; Pei, G. : Identification of a human brain-specific

isoform of mammalian STE20-like kinase 3 that is regulated by c.

[6932] Further studies establishing the function and utilities of STK24 are found in John Hopkins OMIM database record ID 604984, and in cited publications numbered 1622–1623 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362) is another VGAM230 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:733, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6933] Another function of VGAM230 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TIMP3. AF038169 (Accession NM_013310) is another VGAM230 host target gene. AF038169 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by AF038169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AF038169 BINDING SITE, designated SEQ ID:1440, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6934] Another function of VGAM230 is therefore inhibition of AF038169 (Accession NM_013310). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AF038169. CRTAM (Accession NM_019604) is another VGAM230 host target gene. CRTAM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRTAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRTAM BINDING SITE, designated SEQ ID:1883, to the nucleotide sequence

of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6935] Another function of VGAM230 is therefore inhibition of CRTAM (Accession NM_019604). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRTAM. DKFZP564J0863 (Accession XM_043151) is another VGAM230 host target gene. DKFZP564J0863 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564J0863, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564J0863 BINDING SITE, designated SEQ ID:2815, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6936] Another function of VGAM230 is therefore inhibition of DKFZP564J0863 (Accession XM_043151). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564J0863. FLJ14297 (Accession NM_024903) is another VGAM230 host target gene. FLJ14297 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by FLJ14297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14297 BINDING SITE, designated SEQ ID:2108, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6937] Another function of VGAM230 is therefore inhibition of FLJ14297 (Accession NM_024903). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14297. FLJ20508 (Accession NM_017850) is another VGAM230 host target gene. FLJ20508 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20508 BINDING SITE, designated SEQ ID:1757, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6938] Another function of VGAM230 is therefore inhibition of FLJ20508 (Accession NM_017850). Accordingly, utilities of

VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20508. FLJ23462 (Accession NM_024843) is another VGAM230 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:2096, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6939] Another function of VGAM230 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. LOC126167 (Accession XM_058997) is another VGAM230 host target gene. LOC126167 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC126167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126167 BINDING

SITE, designated SEQ ID:2998, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6940] Another function of VGAM230 is therefore inhibition of LOC126167 (Accession XM_058997). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126167. LOC157247 (Accession XM_088275) is another VGAM230 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:3200, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6941] Another function of VGAM230 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC161357 (Accession XM_090827) is another VGAM230 host target gene. LOC161357 BINDING

SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC161357, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161357 BINDING SITE, designated SEQ ID:3240, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6942] Another function of VGAM230 is therefore inhibition of LOC161357 (Accession XM_090827). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161357. LOC201965 (Accession XM_114412) is another VGAM230 host target gene. LOC201965 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC201965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE, designated SEQ ID:3455, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6943] Another function of VGAM230 is therefore inhibition of

LOC201965 (Accession XM_114412). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201965. LOC253758 (Accession XM_173067) is another VGAM230 host target gene. LOC253758 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253758 BINDING SITE, designated SEQ ID:3723, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6944] Another function of VGAM230 is therefore inhibition of LOC253758 (Accession XM_173067). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253758. LOC91661 (Accession NM_138372) is another VGAM230 host target gene. LOC91661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LOC91661 BINDING SITE, designated SEQ ID:2438, to the nucleotide sequence of VGAM230 RNA, herein designated VGAM RNA, also designated SEQ ID:565.

[6945] Another function of VGAM230 is therefore inhibition of LOC91661 (Accession NM_138372). Accordingly, utilities of VGAM230 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 231 (VGAM231) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6946] VGAM231 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM231 was detected is described hereinabove with reference to Figs. 1–8.

[6947] VGAM231 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[6948] VGAM231 gene encodes a VGAM231 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM231 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM231 precursor RNA is designated SEQ ID:217, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:217 is located at position 125645 relative to the genome of Vaccinia Virus.

[6949] VGAM231 precursor RNA folds onto itself, forming VGAM231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6950] An enzyme complex designated DICER COMPLEX, `dices` the VGAM231 folded precursor RNA into VGAM231 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM231 RNA is designated SEQ ID:566, and is provided hereinbelow with reference to the sequence listing part.

[6951] VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM231 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6952] VGAM231 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM231 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM231 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6953] The complementary binding of VGAM231 RNA, herein designated VGAM RNA, to host target binding sites on VGAM231 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM231 host target RNA into VGAM231 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6954] It is appreciated that VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM231 host target genes. The mRNA of each one of this plurality of VGAM231 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM231 RNA, herein designated VGAM RNA, and which when bound by VGAM231 RNA causes inhibition of translation of respective one or more VGAM231 host target proteins.

[6955] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM231 gene, herein designated VGAM GENE, on one or more VGAM231 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6956] It is yet further appreciated that a function of VGAM231 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM231 correlate with, and may be deduced from, the identity of the host target genes which VGAM231 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6957] Nucleotide sequences of the VGAM231 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM231 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM231 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM231 are further described hereinbelow with reference to Table 1.

[6958] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM231 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM231 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6959] As mentioned hereinabove with reference to Fig. 1, a function of VGAM231 gene, herein designated VGAM is inhibition of expression of VGAM231 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM231 correlate with, and may be deduced from, the identity of the target genes which VGAM231 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6960] Spastic Paraplegia 4 (autosomal dominant; spastin) (SPG4, Accession NM_014946) is a VGAM231 host target gene. SPG4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPG4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPG4 BINDING SITE, designated SEQ ID:1595, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:566.

[6961] A function of VGAM231 is therefore inhibition of Spastic Paraplegia 4 (autosomal dominant; spastin) (SPG4, Accession NM_014946), a gene which is probably an ATPase involved in the assembly or function of nuclear protein complexes. Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPG4. The function of SPG4 has been established by previous studies. SPG4 is ubiquitously expressed in human adult and fetal tissue, showing slightly higher expression in fetal brain. Hazan et al. (1999) cloned the mouse ortholog of SPG4, which between amino acids 113 and 616 has 96% identity with human SPG4. Spg4 transcripts are ubiquitously expressed in adult tissues and from embryonic day 7 to 17 in mouse. Interaction with the cytoskeleton was mediated by the N-terminal region of spastin and was regulated through the ATPase activity of the AAA domain. Expression of missense mutations (including 604277.0001, 604277.0002, and 604277.0004) into the AAA domain led to constitutive binding to microtubules in transfected cells and induced the disappearance of the aster and the formation of thick perinuclear bundles, suggesting a role of spastin in microtubule dynamics. Consistently, wildtype spastin pro-

moted microtubule disassembly in transfected cells. The authors suggested that spastin may be involved in microtubule dynamics similarly to the highly homologous microtubule-severing protein katanin (OMIM Ref. No. 606696). The authors hypothesized that impairment of fine regulation of the microtubule cytoskeleton in long axons, due to spastin mutations, may underlie the pathogenesis of hereditary spastic paraplegia

[6962] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6963] Hazan, J.; Fonknechten, N.; Mavel, D.; Paternotte, C.; Samson, D.; Artiguenave, F.; Davoine, C.-S.; Cruaud, C.; Durr, A.; Wincker, P.; Brottier, P.; Cattolico, L.; Barbe, V.; Burgunder, J.-M.; Prud'homme, J.-F.; Brice, A.; Fontaine, B.; Heilig, R.; Weissenbach, J. : Spastin, a new AAA protein, is altered in the most frequent form of autosomal dominant spastic paraplegia. *Nature Genet.* 23: 296–303, 1999. ; and

[6964] Errico, A.; Ballabio, A.; Rugarli, E. I. : Spastin, the protein mutated in autosomal dominant hereditary spastic paraplegia, is involved in microtubule dynamics. *Hum. Molec. Genet.* 11: 153.

[6965] Further studies establishing the function and utilities of SPG4 are found in John Hopkins OMIM database record ID 604277, and in cited publications numbered 2388–1665, 2389–1670, 1666, 2390–174 and 2391 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0672 (Accession NM_014859) is another VGAM231 host target gene. KIAA0672 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0672 BINDING SITE, designated SEQ ID:1569, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:566.

[6966] Another function of VGAM231 is therefore inhibition of KIAA0672 (Accession NM_014859). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0672. MGC32104 (Accession NM_144684) is another VGAM231 host target gene. MGC32104 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC32104, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC32104 BINDING SITE, designated SEQ ID:2495, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:566.

[6967] Another function of VGAM231 is therefore inhibition of MGC32104 (Accession NM_144684). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC32104. PRO0082 (Accession NM_018590) is another VGAM231 host target gene. PRO0082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0082, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0082 BINDING SITE, designated SEQ ID:1851, to the nucleotide sequence of VGAM231 RNA, herein designated VGAM RNA, also designated SEQ ID:566.

[6968] Another function of VGAM231 is therefore inhibition of PRO0082 (Accession NM_018590). Accordingly, utilities of VGAM231 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRO0082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 232 (VGAM232) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6969] VGAM232 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM232 was detected is described hereinabove with reference to Figs. 1–8.

[6970] VGAM232 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6971] VGAM232 gene encodes a VGAM232 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM232 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM232 precursor RNA is designated SEQ ID:218, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:218 is located at position 125237 relative to the genome of Vaccinia Virus.

[6972] VGAM232 precursor RNA folds onto itself, forming VGAM232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6973] An enzyme complex designated DICER COMPLEX, `dices` the VGAM232 folded precursor RNA into VGAM232 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM232 RNA is designated SEQ ID:567, and is provided hereinbelow with reference to the sequence listing part.

[6974] VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM232 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6975] VGAM232 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM232 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM232 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6976] The complementary binding of VGAM232 RNA, herein designated VGAM RNA, to host target binding sites on VGAM232 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM232 host target RNA into VGAM232 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6977] It is appreciated that VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM232 host target genes. The mRNA of each one of this plurality of VGAM232 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM232 RNA, herein designated VGAM RNA, and which when bound by VGAM232 RNA causes in-

hibition of translation of respective one or more VGAM232 host target proteins.

[6978] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM232 gene, herein designated VGAM GENE, on one or more VGAM232 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6979] It is yet further appreciated that a function of VGAM232 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM232 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM232 correlate with, and may be deduced from, the identity of the host target genes which VGAM232 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[6980] Nucleotide sequences of the VGAM232 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM232 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM232 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM232 are further described hereinbelow with reference to Table 1.

[6981] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM232 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM232 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6982] As mentioned hereinabove with reference to Fig. 1, a function of VGAM232 gene, herein designated VGAM is inhibition of expression of VGAM232 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM232 correlate with, and may be deduced from, the identity of the target genes which VGAM232 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[6983] Tumor Rejection Antigen (gp96) Pseudogene 1 (TRAP1, Accession NM_016292) is a VGAM232 host target gene. TRAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAP1 BINDING SITE, designated SEQ ID:1678, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6984] A function of VGAM232 is therefore inhibition of Tumor Rejection Antigen (gp96) Pseudogene 1 (TRAP1, Accession NM_016292), a gene which chaperone that expresses an atpase activity. Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAP1. The function of TRAP1 has been established by previous studies. Using a yeast 2-hybrid screen of a Gal4/HeLa cDNA library with

the intracellular domain of TNFR1 (OMIM Ref. No. 191190) as bait, followed by 5-prime RACE, Song et al. (1995) isolated a partial cDNA encoding TRAP1. The deduced 661-amino acid protein is 60% similar to HSP90 family members, although it lacks the highly charged domain found in HSP90 proteins. Northern blot analysis revealed variable but ubiquitous expression of a 2.7-kb TRAP1 transcript. GST pull-down analysis indicated that TRAP1 interacts with the N-terminal half of TNFR1. By yeast 2-hybrid screening of several cDNA libraries with an N-terminally truncated retinoblastoma protein (RB; 180200) as bait, Chen et al. (1996) obtained a nearly complete cDNA encoding TRAP1, which they termed HSP75. HSP75 has 698 amino acids. Immunoprecipitation, immunoblot analysis, and immunofluorescence microscopy demonstrated expression of a 75-kD cytoplasmic protein that colocalizes with RB during mitosis but not during other phases. During heat shock, HSP75 migrates to the nucleus. Binding analysis showed that HSP75 uses an LxCxE motif to bind to the T antigen-binding domains of RB. Western blot analysis indicated that HSP75 is able to re-fold denatured RB, suggesting that HSP75 acts as a chaperone for RB. In a yeast 2-hybrid screen with exostosin-2

(EXT2; 133701) as bait, Simmons et al. (1999) isolated TRAP1. They reported that the full-length cDNA sequence encodes a 704-amino acid protein (GenBank AF154108). Binding analysis determined that TRAP1 interacts with the C-terminal ends of the proteins encoded by both multiple exostoses-causing genes, EXT1 (OMIM Ref. No. 133700) and EXT2, but not with EXTL1 (OMIM Ref. No. 601738) or EXTL3 (OMIM Ref. No. 605744). The interaction requires the presence of a his residue in the EXT proteins, the loss of which had been identified in a single family with type I multiple exostoses (OMIM Ref. No. 133700) by Raskind et al. (1998). Felts et al. (2000) reported that TRAP1 lacks the chaperone activities of HSP90 and also fails to interact with cochaperones of HSP90. However, TRAP1 does bind ATP and expresses an ATPase activity that can be blocked by the HSP90 inhibitor geldanamycin. Immunofluorescence microscopy demonstrated a mitochondrial localization for TRAP1. TRAP1 possesses a mitochondrial localization sequence, STQTAED, beginning after cleavage at position 59. Sequence analysis predicted that TRAP1 is 54% identical to a *Drosophila* homolog.

[6985] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [6986] Felts, S. J.; Owen, B. A. L.; Nguyen, P.; Trepel, J.; Donner, D. B.; Toft, D. O. : The hsp90-related protein TRAP1 is a mitochondrial protein with distinct functional properties. J. Biol. Chem. 275: 3305–3312, 2000. ; and
- [6987] Raskind, W. H.; Conrad, E. U., III; Matsushita, M.; Wijsman, E. M.; Wells, D. E.; Chapman, N.; Sandell, L. J.; Wagner, M.; Houck, J. : Evaluation of locus heterogeneity and EXT1 mutati.
- [6988] Further studies establishing the function and utilities of TRAP1 are found in John Hopkins OMIM database record ID 606219, and in cited publications numbered 1525–1526, 85 and 2721 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ASAH (Accession NM_004315) is another VGAM232 host target gene. ASAH BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ASAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASAH BINDING SITE, designated SEQ ID:1098, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:567.

[6989] Another function of VGAM232 is therefore inhibition of ASAH (Accession NM_004315). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASAH. Cyclin M1 (CNNM1, Accession NM_020348) is another VGAM232 host target gene. CNNM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM1 BINDING SITE, designated SEQ ID:1913, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6990] Another function of VGAM232 is therefore inhibition of Cyclin M1 (CNNM1, Accession NM_020348). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNNM1. Rab11-FIP2 (Accession NM_014904) is another VGAM232 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:1582, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6991] Another function of VGAM232 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. Ring Finger Protein 38 (RNF38, Accession NM_022781) is another VGAM232 host target gene. RNF38 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RNF38, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF38 BINDING SITE, designated SEQ ID:2009, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6992] Another function of VGAM232 is therefore inhibition of Ring Finger Protein 38 (RNF38, Accession NM_022781). Accordingly, utilities of VGAM232 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with RNF38. LOC152283 (Accession XM_098196) is another VGAM232 host target gene. LOC152283 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152283, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152283 BINDING SITE, designated SEQ ID:3357, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6993] Another function of VGAM232 is therefore inhibition of LOC152283 (Accession XM_098196). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152283. LOC160484 (Accession XM_090326) is another VGAM232 host target gene. LOC160484 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC160484, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC160484 BINDING SITE, designated SEQ ID:3239, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6994] Another function of VGAM232 is therefore inhibition of LOC160484 (Accession XM_090326). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160484. LOC90119 (Accession XM_029167) is another VGAM232 host target gene. LOC90119 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90119, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90119 BINDING SITE, designated SEQ ID:2600, to the nucleotide sequence of VGAM232 RNA, herein designated VGAM RNA, also designated SEQ ID:567.

[6995] Another function of VGAM232 is therefore inhibition of LOC90119 (Accession XM_029167). Accordingly, utilities of VGAM232 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90119. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 233 (VGAM233) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6996] VGAM233 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM233 was detected is described hereinabove with reference to Figs. 1–8.

[6997] VGAM233 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6998] VGAM233 gene encodes a VGAM233 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM233 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM233 precursor RNA is designated SEQ ID:219, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:219 is located at position 125406 relative to the genome of Vac–

cinia Virus.

[6999] VGAM233 precursor RNA folds onto itself, forming VGAM233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7000] An enzyme complex designated DICER COMPLEX, `dices` the VGAM233 folded precursor RNA into VGAM233 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM233 RNA is designated SEQ ID:568, and is provided hereinbelow with reference to the sequence listing part.

[7001] VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM233 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7002] VGAM233 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM233 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM233 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7003] The complementary binding of VGAM233 RNA, herein designated VGAM RNA, to host target binding sites on VGAM233 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM233 host target RNA into VGAM233 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7004] It is appreciated that VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM233 host target genes. The mRNA of each one of this plurality of VGAM233 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM233 RNA, herein designated VGAM RNA, and which when bound by VGAM233 RNA causes inhibition of translation of respective one or more VGAM233 host target proteins.

[7005] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM233 gene, herein designated VGAM GENE, on one or more VGAM233 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7006] It is yet further appreciated that a function of VGAM233 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM233 correlate

with, and may be deduced from, the identity of the host target genes which VGAM233 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7007] Nucleotide sequences of the VGAM233 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM233 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM233 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM233 are further described hereinbelow with reference to Table 1.

[7008] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM233 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM233 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7009] As mentioned hereinabove with reference to Fig. 1, a function of VGAM233 gene, herein designated VGAM is inhibition of expression of VGAM233 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM233 correlate with, and may be deduced

from, the identity of the target genes which VGAM233 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7010] Myotubularin Related Protein 2 (MTMR2, Accession NM_016156) is a VGAM233 host target gene. MTMR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR2 BINDING SITE, designated SEQ ID:1664, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:568.

[7011] A function of VGAM233 is therefore inhibition of Myotubularin Related Protein 2 (MTMR2, Accession NM_016156). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR2. Protocadherin Gamma Subfamily A, 8 (PCDHGA8, Accession NM_032088) is another VGAM233 host target gene. PCDHGA8 BINDING SITE1 and PCDHGA8 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHGA8, corresponding to HOST TARGET

binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHGA8 BINDING SITE1 and PCDHGA8 BINDING SITE2, designated SEQ ID:2227 and SEQ ID:1460 respectively, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:568.

[7012] Another function of VGAM233 is therefore inhibition of Protocadherin Gamma Subfamily A, 8 (PCDHGA8, Accession NM_032088), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHGA8. The function of PCDHGA8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM207.SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108) is another VGAM233 host target gene. SOX11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SOX11 BINDING SITE, designated SEQ ID:991, to the nucleotide sequence of VGAM233 RNA, herein designated VGAM RNA, also designated SEQ ID:568.

[7013] Another function of VGAM233 is therefore inhibition of SRY (sex determining region Y)-box 11 (SOX11, Accession NM_003108). Accordingly, utilities of VGAM233 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX11. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 234 (VGAM234) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7014] VGAM234 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM234 was detected is described hereinabove with reference to Figs. 1-8.

[7015] VGAM234 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[7016] VGAM234 gene encodes a VGAM234 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM234 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM234 precursor RNA is designated SEQ ID:220, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:220 is located at position 123394 relative to the genome of Vaccinia Virus.

[7017] VGAM234 precursor RNA folds onto itself, forming VGAM234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7018] An enzyme complex designated DICER COMPLEX, `dices` the VGAM234 folded precursor RNA into VGAM234 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM234 RNA is designated SEQ ID:569, and is provided hereinbelow with reference to the sequence listing part.

[7019] VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM234 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7020] VGAM234 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM234 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM234 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7021] The complementary binding of VGAM234 RNA, herein designated VGAM RNA, to host target binding sites on VGAM234 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM234 host target RNA into VGAM234 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7022] It is appreciated that VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM234 host target genes. The mRNA of each one of this plurality of VGAM234 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM234 RNA, herein designated VGAM RNA, and which when bound by VGAM234 RNA causes inhibition of translation of respective one or more VGAM234 host target proteins.

[7023] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM234 gene, herein designated VGAM GENE, on one or more VGAM234 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7024] It is yet further appreciated that a function of VGAM234 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM234 correlate with, and may be deduced from, the identity of the host target genes which VGAM234 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7025] Nucleotide sequences of the VGAM234 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM234 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM234 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM234 are further described hereinbelow with reference to Table 1.

[7026] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM234 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM234 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7027] As mentioned hereinabove with reference to Fig. 1, a function of VGAM234 gene, herein designated VGAM is inhibition of expression of VGAM234 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM234 correlate with, and may be deduced from, the identity of the target genes which VGAM234 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7028] Complement Component 6 (C6, Accession XM_170508) is a VGAM234 host target gene. C6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6 BINDING SITE, designated SEQ ID:3656, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7029] A function of VGAM234 is therefore inhibition of Complement Component 6 (C6, Accession XM_170508). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6. Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM_000737) is another VGAM234 host target gene. CGB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB BINDING SITE, designated SEQ ID:770, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7030] Another function of VGAM234 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide (CGB, Accession NM_000737), a gene which stimulates the ovaries to synthesize the steroids. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB. The function of CGB has been established by previous studies. Human chorionic gonadotropin (hCG) is a glycoprotein hormone produced by trophoblastic cells of the placenta beginning

10 to 12 days after conception. Maintenance of the fetus in the first trimester of pregnancy requires the production of hCG, which binds to the corpus luteum of the ovary which is stimulated to produce progesterone which in turn maintains the secretory endometrium. See 118850.

Boorstein et al. (1982) concluded that the beta subunit of CG is encoded by at least 8 genes arranged in tandem and inverted pairs. They stated that 'until sequence analysis is complete, we cannot exclude the possibility that the eight genes include some pseudogenes or the related gene, beta-LH.' The beta subunits of luteinizing hormone (LHB) and CG show about 82% amino acid homology. The homology with beta-FSH and beta-TSH is much lower. Policastro et al. (1983, 1986) found 6 nonallelic copies of the CGB gene and a single-copy LHB gene. All were contained in a single 58-kb EcoRI fragment. The hCG beta-subunit is unique in the family of beta-containing glycoprotein hormones in that it contains an extension of 29 amino acids at its COOH end. Amato et al. (2002) reported a patient with a 9-year history of secondary infertility due to an anti-CG autoantibody. Although she had regular menstrual cycles, had conceived spontaneously, and had good hormonal and follicular responses to gonadotropic stimu-

lation regimens during the in vitro fertilization workup, she presented with apparent recurrent pregnancy loss associated with prolonged raised CG levels. She was found to have specific, low-affinity, but high-capacity anti-CG antibody. Crossreaction with recombinant FSH, recombinant LH, CG-alpha, and CG-beta was low. In addition, heat-inactivated serum and the affinity-purified IgG were shown to inhibit the action of CG in an in vitro bioassay. The authors concluded that the persisting titer of the antibody was responsible for the patient's infertility.

[7031] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7032] Policastro, P. F.; Daniels-McQueen, S.; Carle, G.; Boime, I. : A map of the hCG-beta-LH-beta gene cluster. J. Biol. Chem. 261: 5907-5916, 1986. ; and

[7033] Amato, F.; Warnes, G. M.; Kirby, C. A.; Norman, R. J. : Infertility caused by hCG autoantibody. J. Clin. Endocr. Metab. 87: 993-997, 2002.

[7034] Further studies establishing the function and utilities of CGB are found in John Hopkins OMIM database record ID 118860, and in cited publications numbered 2862, 2924-2929, 2492, 286 and 2930-2933 listed in the bibli-

ography section hereinbelow, which are also hereby incorporated by reference. Cullin 3 (CUL3, Accession NM_003590) is another VGAM234 host target gene. CUL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CUL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CUL3 BINDING SITE, designated SEQ ID:1040, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7035] Another function of VGAM234 is therefore inhibition of Cullin 3 (CUL3, Accession NM_003590), a gene which may target other proteins for ubiquitin-dependent proteolysis. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CUL3. The function of CUL3 has been established by previous studies. Kipreos et al. (1996) identified a conserved gene family, designated cullins, with at least 5 members in nematodes, 6 in humans, and 3 in *S. cerevisiae*. See CUL1 (OMIM Ref. No. 603134). Human CUL3 is an ortholog of nematode cul3. Michel and Xiong (1998) identified human CUL3 cDNAs and reported that

the predicted protein is 768 amino acids long. Ishikawa et al. (1998) isolated a CUL3 cDNA, KIAA0617, as 1 of 100 brain cDNAs encoding large proteins. Using RT-PCR, they found that CUL3 is expressed in several tissues. Du et al. (1998) identified CUL3 as a gene whose expression in human fibroblasts is induced by phorbol 12-myristate 13-acetate (PMA) and suppressed by salicylate. They reported that the sequences of the human and *C. elegans* cul3 proteins share 46% identity. Northern blot analysis revealed that CUL3 is expressed as major 2.8- and minor 4.3-kb transcripts in various human tissues, with the highest levels in skeletal muscle and heart.

[7036] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7037] Du, M.; Sansores-Garcia, L.; Zu, Z.; Wu, K. K. : Cloning and expression analysis of a novel salicylate suppressible gene, Hs-CUL-3, a member of cullin/Cdc53 family. *J. Biol. Chem.* 273: 24289-24292, 1998. ; and

[7038] Ishikawa, K.; Nagase, T.; Suyama, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. X. The complete seque.

[7039] Further studies establishing the function and utilities of CUL3 are found in John Hopkins OMIM database record ID 603136, and in cited publications numbered 1151, 2136–213 and 1150 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376) is another VGAM234 host target gene. GRINL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRINL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRINL1A BINDING SITE, designated SEQ ID:2863, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7040] Another function of VGAM234 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376), a gene which plays a role in the development and function of the mammalian brain. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINL1A. The function

of GRINL1A has been established by previous studies. The ionotropic glutamate receptors (e.g., GRIN1; 138249) play roles in the development and function of the mammalian brain. Roginski et al. (2001) isolated rat GRINL1 cDNA from a size-fractionated, directional rat brain cDNA library. They obtained human GRINL1A genomic DNA sequences by amplification with primers designed from the rat sequences. By fluorescence in situ hybridization, Roginski et al. (2001) mapped the GRINL1A gene to chromosome 15q22.1. By interspecific backcross analysis, Wydner et al. (2001) mapped the mouse Grinl1a gene to chromosome 9 in a region that shares linkage conservation with human chromosome 15q21-q22.

[7041] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7042] Roginski, R. S.; Mohan Raj, B. K.; Finkernagel, S. W.; Sciorra, L. J. : Assignment of an ionotropic glutamate receptor-like gene (GRINL1A) to human chromosome 15q22.1 by in situ hybridization. Cytogenet. Cell Genet. 93: 143-144, 2001. ; and

[7043] Wydner, K. S.; Mohan Raj, B. K.; Sciorra, L. J.; Roginski, R. S. : The mouse orthologue of the human ionotropic gluta-

mate receptor-like gene (GRINL1A) maps to mouse chromosome 9. Cytog.

[7044] Further studies establishing the function and utilities of GRINL1A are found in John Hopkins OMIM database record ID 606485, and in cited publications numbered 1273–1274 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258) is another VGAM234 host target gene. PRKG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKG1 BINDING SITE, designated SEQ ID:1283, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7045] Another function of VGAM234 is therefore inhibition of Protein Kinase, CGMP-dependent, Type I (PRKG1, Accession NM_006258), a gene which relaxes vascular smooth muscle and inhibits platelet aggregation. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with PRKG1. The function of PRKG1 has been established by previous studies. Cyclic GMP and cyclic GMP-dependent protein kinase play important roles in physiologic processes such as relaxation of vascular smooth muscle and inhibition of platelet aggregation. Two main forms of cGK have been identified: a soluble form designated type I and an intrinsic membrane-bound form designated type II. Sandberg et al. (1989) isolated and characterized cDNA clones for the type I beta isozyme from human placenta libraries. The same group used a genomic probe for mapping the gene (Orstavik et al., 1992). By Southern blots of human/hamster somatic cell hybrids, they localized the PRKGR1B gene to chromosome 10. The gene was regionally localized to 10q11.2 by in situ hybridization. Tamura et al. (1996) cloned a human cGKI-alpha cDNA by RT-PCR of aorta RNA using primers based on the sequence of a bovine cGKI-alpha cDNA. The predicted 671-amino acid human cGKI-alpha protein is nearly identical to bovine cGKI-alpha. Based on Southern blot and sequence analyses, Tamura et al. (1996) suggested that cGKI-alpha and cGKI-beta are generated by alternative splicing of a single gene that maps to chromosome 10. By Northern blot analysis, cGKI-alpha was abundantly expressed as a

7.0-kb mRNA in aorta, heart, kidneys and adrenals; the 7.0-kb cGKI-beta mRNA was abundantly expressed only in the uterus. Orstavik et al. (1997) noted that type I cGK is a homodimer, with each monomer containing a regulatory cGMP-binding domain and a catalytic domain. They reported that the type I cGK gene consists of 19 exons spanning at least 220 kb. The first 2 exons, which the authors called 1-alpha and 1-beta, are used alternatively and encode the alpha isoform- and beta isoform-specific sequences. By Northern blot analysis, type I cGK-alpha mRNA was most abundant in lung and placenta, while type I cGK-beta was expressed at highest levels in bladder, uterus, adrenal gland, and fallopian tube. Orstavik et al. (1997) noted that 5 of the 7 splice sites in the *Drosophila melanogaster* DG2 gene, which encodes a cGK, are also present in the human type I cGK gene. Osborne et al. (1997) reported that levels of the DG2-encoded cGK in *Drosophila* affect food-search behavior and account for a naturally occurring behavioral polymorphism. Animal model experiments lend further support to the function of PRKG1. Pfeifer et al. (1998) generated mice deficient in cGKI by targeted disruption. Loss of cGKI abolished nitric oxide/cGMP-dependent relaxation of smooth muscle, re-

sulting in severe vascular and intestinal dysfunction. However, cGKI-deficient smooth muscle responded normally to cAMP, indicating that cAMP and cGMP signal via independent pathways, with cGKI being the specific mediator of the nitric oxide/cGMP effects in murine smooth muscle.

[7046] It is appreciated that the abovementioned animal model for PRKG1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7047] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7048] Pfeifer, A.; Klatt, P.; Massberg, S.; Ny, L.; Sausbier, M.; Hirneill, C.; Wang, G.-X.; Korth, M.; Aszodi, A.; Andersson, K.-E.; Krombach, F.; Mayerhofer, A.; Ruth, P.; Fassler, R.; Hofmann, F. : Defective smooth muscle regulation in cGMP kinase I-deficient mice. EMBO J. 17: 3045-3051, 1998. ; and

[7049] Sandberg, M.; Natarajan, V.; Ronander, I.; Kalderon, D.; Walter, U.; Lohmann, S. M.; Jahnsen, T. : Molecular cloning and predicted full-length amino acid sequence of the type I beta isoz.

[7050] Further studies establishing the function and utilities of

PRKG1 are found in John Hopkins OMIM database record ID 176894, and in cited publications numbered 273–278 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133334) is another VGAM234 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:2409, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7051] Another function of VGAM234 is therefore inhibition of Wolf–Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_133334), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 has been established by previous studies. Wolf–Hirschhorn syndrome (WHS; 194190) is a malformation syndrome associated with a hemizygous deletion of

the distal short arm of chromosome 4 (OMIM Ref. No. 4p16.3). The shortest region of overlap of the deletions observed in WHS patients, the WHS critical region, has been confined to a region of 165 kb (Wright et al., 1997). This region was sequenced completely during the search for the Huntington disease gene (Baxendale et al., 1993). Stec et al. (1998) described a novel developmental gene, two-thirds of which maps in the distal part of the WHS critical region. They designated the gene WHSC1 (Wolf-Hirschhorn syndrome candidate-1). The WHSC1 gene was identified initially through its high similarity to the translation product of an expressed sequence tag, located in the 165-kb WHCR, with the SET domain (see OMIM Ref. No. 600960) of the *Drosophila* protein ASH1 (OMIM Ref. No. 100790). The SET domain is found in proteins that are involved in embryonic development. The 25-exon WHSC1 gene was found to be expressed ubiquitously in early development and to undergo complex alternative splicing and differential polyadenylation. It encodes a 136-kD protein containing 4 domains present in other developmental proteins: a PWWP domain, an HMG box, a SET domain also found in the *Drosophila* dysmorphia gene ash-encoded protein, and a PHD-type zinc fin-

ger. It is expressed preferentially in rapidly growing embryonic tissues, in a pattern corresponding to affected organs in WHS patients. The nature of the protein motifs, the expression pattern, and its mapping to the critical region led Stec et al. (1998) to propose WHSC1 as a good candidate gene to be responsible for many of the phenotypic features of WHS. Stec et al. (1998) noted that the t(4;14)(p16.3;q32.3) translocations described in a significant fraction of multiple myelomas (Richelda et al., 1997; Chesi et al., 1997) have breakpoints located less than 100 kb centromeric of the FGFR3 gene (OMIM Ref. No. 134934) on 4p16.3. They found that at least 3 of the breakpoints merged the immunoglobulin heavy-chain gene (IGHG1; 147100) on chromosome 14 with the WHSC1 gene. This fusion of genes and their untimely expression in the myeloid lineage driven from the 5-prime IgH enhancer may indicate that WHSC1-encoded proteins are involved in the clinical heterogeneity of multiple myeloma.

[7052] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7053] Chesi, M.; Nardini, E.; Brents, L. A.; Schrock, E.; Ried, T.;

Kuehl, W. M.; Bergsagel, P. L. : Frequent translocation t(4;14)(p16.3;q32.3) in multiple myeloma is associated with increased expression and activating mutations of fibroblast growth factor receptor 3. Nature Genet. 16: 260–264, 1997. ; and

[7055] Further studies establishing the function and utilities of WHSC1 are found in John Hopkins OMIM database record ID 602952, and in cited publications numbered 236, 263 and 1823 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043) is another VGAM234 host target gene. CGB5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CGB5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CGB5 BINDING SITE, designated SEQ ID:2311, to the nucleotide sequence of VGAM234 RNA, herein designated

VGAM RNA, also designated SEQ ID:569.

[7056] Another function of VGAM234 is therefore inhibition of Chorionic Gonadotropin, Beta Polypeptide 5 (CGB5, Accession NM_033043). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CGB5. DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM_020162) is another VGAM234 host target gene. DDX33 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDX33, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDX33 BINDING SITE, designated SEQ ID:1895, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7057] Another function of VGAM234 is therefore inhibition of DEAD/H (Asp-Glu-Ala-Asp/His) Box Polypeptide 33 (DDX33, Accession NM_020162). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDX33. FLJ20296 (Accession NM_017750) is another VGAM234

host target gene. FLJ20296 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ20296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20296 BINDING SITE, designated SEQ ID:1749, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7058] Another function of VGAM234 is therefore inhibition of FLJ20296 (Accession NM_017750). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20296. IRO039700 (Accession NM_018671) is another VGAM234 host target gene. IRO039700 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by IRO039700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRO039700 BINDING SITE, designated SEQ ID:1858, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7059] Another function of VGAM234 is therefore inhibition of IRO039700 (Accession NM_018671). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRO039700. KIAA0594 (Accession XM_036117) is another VGAM234 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:2706, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7060] Another function of VGAM234 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886) is another VGAM234 host target gene. MAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAL2, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAL2 BINDING SITE, designated SEQ ID:2343, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7061] Another function of VGAM234 is therefore inhibition of Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAL2. LOC145622 (Accession XM_085186) is another VGAM234 host target gene. LOC145622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145622 BINDING SITE, designated SEQ ID:3080, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7062] Another function of VGAM234 is therefore inhibition of LOC145622 (Accession XM_085186). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC145622. LOC152982 (Accession XM_087574) is another VGAM234 host target gene. LOC152982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152982 BINDING SITE, designated SEQ ID:3176, to the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7063] Another function of VGAM234 is therefore inhibition of LOC152982 (Accession XM_087574). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152982. LOC256174 (Accession XM_174823) is another VGAM234 host target gene. LOC256174 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256174 BINDING SITE, designated SEQ ID:3742, to

the nucleotide sequence of VGAM234 RNA, herein designated VGAM RNA, also designated SEQ ID:569.

[7064] Another function of VGAM234 is therefore inhibition of LOC256174 (Accession XM_174823). Accordingly, utilities of VGAM234 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256174. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 235 (VGAM235) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7065] VGAM235 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM235 was detected is described hereinabove with reference to Figs. 1–8.

[7066] VGAM235 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7067] VGAM235 gene encodes a VGAM235 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM235 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM235 precursor RNA is designated SEQ ID:221, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:221 is located at position 123220 relative to the genome of Vaccinia Virus.

[7068] VGAM235 precursor RNA folds onto itself, forming VGAM235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7069] An enzyme complex designated DICER COMPLEX, `dices` the VGAM235 folded precursor RNA into VGAM235 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM235 RNA is designated SEQ ID:570, and is provided hereinbelow with reference to the sequence listing part.

[7070] VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM235 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7071] VGAM235 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM235 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM235 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7072] The complementary binding of VGAM235 RNA, herein designated VGAM RNA, to host target binding sites on VGAM235 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM235 host target RNA into VGAM235 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7073] It is appreciated that VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM235 host target genes. The mRNA of each one of this plurality of VGAM235 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM235 RNA, herein designated VGAM RNA, and which when bound by VGAM235 RNA causes inhibition of translation of respective one or more VGAM235 host target proteins.

[7074] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM235 gene, herein designated VGAM GENE, on one or more VGAM235 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[7075] It is yet further appreciated that a function of VGAM235 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM235 correlate with, and may be deduced from, the identity of the host target genes which VGAM235 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[7076] Nucleotide sequences of the VGAM235 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM235 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM235 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM235 are further described hereinbelow with reference to Table 1.

[7077] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM235 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM235 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7078] As mentioned hereinabove with reference to Fig. 1, a function of VGAM235 gene, herein designated VGAM is inhibition of expression of VGAM235 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM235 correlate with, and may be deduced from, the identity of the target genes which VGAM235 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7079] Calcitonin Receptor (CALCR, Accession NM_001742) is a VGAM235 host target gene. CALCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCR BINDING SITE, designated SEQ ID:854, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7080] A function of VGAM235 is therefore inhibition of Calcitonin Receptor (CALCR, Accession NM_001742), a gene

which is a receptor for calcitonin, is mediated by g proteins which activate adenylyl cyclase, and thought to couple to the heterotrimeric guanosine triphosphate-binding protein that is sensitive to cholera toxin. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CALCR. The function of CALCR has been established by previous studies. Taboulet et al. (1996) had reported the point mutation polymorphism (OMIM Ref. No. T to C) in the 3-prime region of the CALCR gene which induced a pro447-to-leu amino acid change in the third intracellular domain of the protein. This was the same mutation as that subsequently identified by Nakamura et al. (1997) and Masi et al. (1998) and referred to as pro463 to leu; the difference in numbering depended on whether isoform 1 or isoform 2 of the calcitonin receptor, with or without the 16-amino acid insert, was referred to (de Vernejoul, 1999). Taboulet et al. (1998) studied the distribution of these alleles in a cohort of 123 women with no osteoporotic fractures and 92 women who presented with one or more osteoporotic fractures of wrist or vertebrae. They found that bone mineral density of the femoral neck was significantly higher in heterozygous subjects compared

with the homozygous leucine and homozygous proline genotypes. Also, a decreased fracture risk was observed in heterozygote subjects. In conclusion, they suggested that polymorphism of CALCR is associated with osteoporotic factors and bone mineral density in a population of post-menopausal women. The heterozygous advantage of the pro/leu subjects could explain their protection against osteoporosis. The distribution of the CALCR alleles in the French population studied by Taboulet et al. (1998) was quite different from that observed by Nakamura et al. (1997) in the Japanese population. In Japan, the proline homozygote was the most frequent genotype (70%), Gorn et al. (1992) cloned a human calcitonin receptor cDNA from a eukaryotic expression library prepared from an ovarian small cell carcinoma cell line. A cell line had been shown to respond to calcitonin (CT, or CALCA; 114130) with increases in content of cellular cAMP. Transfection of this cDNA into COS cells resulted in expression of receptors with high affinity for salmon and human calcitonin. The expressed CALCR was coupled to adenylate cyclase. Northern analysis indicated a single transcript of about 4.2 kb. The cloned cDNA encoded a putative peptide of 490 amino acids with 7 potential transmembrane do-

mains. The amino acid sequence was 73% identical to porcine CALCR, although the human CALCR contained an inset of 16 amino acids between transmembrane domains I and II. CALCR is closely related to the parathyroid hormone receptor (OMIM Ref. No. 168468) and the secretin receptor (OMIM Ref. No. 182098); these receptors comprise a distinct family of G protein-coupled 7-transmembrane domain receptors. A comparison of the human CALCR sequence to protein sequences in databases suggested that the receptor for calcitonin is evolutionarily related to the chemoattractant receptor of the primitive eukaryote *Dictyostelium discoideum*.

[7081] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7082] Gorn, A. H.; Lin, H. Y.; Yamin, M.; Auron, P. E.; Flannery, M. R.; Tapp, D. R.; Manning, C. A.; Lodish, H. F.; Krane, S. M.; Goldring, S. R. : Cloning, characterization, and expression of a human calcitonin receptor from an ovarian carcinoma cell line. *J. Clin. Invest.* 90: 1726-1735, 1992. ; and

[7083] Taboulet, J.; Frenkian, M.; Frendo, J. L.; Feingold, N.; Jullienne, A.; de Vernejoul, M. C. : Calcitonin receptor polymorphism is associated with a decreased fracture risk in

post-menop.

[7084] Further studies establishing the function and utilities of CALCR are found in John Hopkins OMIM database record ID 114131, and in cited publications numbered 542–544, and 3028–3033 listed in the bibliography section herein–below, which are also hereby incorporated by reference. Interleukin 1 Family, Member 9 (IL1F9, Accession NM_019618) is another VGAM235 host target gene. IL1F9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IL1F9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL1F9 BINDING SITE, designated SEQ ID:1886, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7085] Another function of VGAM235 is therefore inhibition of Interleukin 1 Family, Member 9 (IL1F9, Accession NM_019618), a gene which initiates and promotes the host response to injury or infection by activating a set of transcription factors. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL1F9. The function

of IL1F9 has been established by previous studies. The cytokine interleukin-1 (IL1; OMIM Ref. No. 147760) elicits a wide array of biologic activities that initiate and promote the host response to injury or infection by activating a set of transcription factors, including NFkB (see OMIM Ref. No. 164011) and AP1 (see OMIM Ref. No. 165160), which in turn induce production of effectors of the inflammatory response. By searching EST databases for IL1 homologs, Kumar et al. (2000) identified a cDNA encoding IL1H1. The deduced 169-amino acid protein, which shares 19 to 32% sequence similarity with other IL1 family members, lacks a hydrophobic leader peptide and a prodomain. Biophysical analyses indicated that IL1H1 has 12 beta strands, similar to other IL1 family members. Northern blot analysis detected no expression of IL1H1 in a multiple tissue blot. PCR analysis detected low levels of expression in lungs and macrophages. RT-PCR and Western blot analyses showed that cytokine-induced keratinocytes expressed readily detectable IL1H1. In situ hybridization analysis demonstrated IL1H1 expression in keratinocytes in a mouse model of contact hypersensitivity or herpes simplex virus infection. By sequencing a BAC clone containing the IL1B gene (OMIM Ref. No. 147720) and search-

ing EST databases for IL1-like ligands, Busfield et al. (2000) identified IL1H1, which they designated IL1RP2. SDS-PAGE analysis showed that IL1H1 is expressed as a 20-kD protein. Northern blot analysis detected a 1.8-kb IL1H1 transcript in the squamous cell epithelium of the esophagus. In situ hybridization analysis revealed expression in the middle layers of epithelium. In vitro, IL1H1 message was rapidly induced following stimulation of keratinocytes. Reporter and bioassays failed to detect agonist or antagonist activity for NFKB.

[7086] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7087] Busfield, S. J.; Comrack, C. A.; Yu, G.; Chickering, T. W.; Smutko, J. S.; Zhou, H.; Leiby, K. R.; Holmgren, L. M.; Gearing, D. P.; Pan, Y. : Identification and gene organization of three novel members of the IL-1 family on human chromosome 2. *Genomics* 66: 213-216, 2000. ; and

[7088] Kumar, S.; McDonnell, P. C.; Lehr, R.; Tierney, L.; Tzimas, M. N.; Griswold, D. E.; Capper, E. A.; Tal-Singer, R.; Wells, G. I.; Doyle, M. L.; Young, P. R. : Identification and initial.

[7089] Further studies establishing the function and utilities of IL1F9 are found in John Hopkins OMIM database record ID

605542, and in cited publications numbered 1007 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM_000595) is another VGAM235 host target gene. LTA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTA BINDING SITE, designated SEQ ID:757, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7090] Another function of VGAM235 is therefore inhibition of Lymphotoxin Alpha (TNF superfamily, member 1) (LTA, Accession NM_000595), a gene which is a cytokine that in its homotrimeric form binds to tnfrsf1a/tnfr1, tnfrsf1b/tnfr and tnfrsf14/hvem. Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTA. The function of LTA has been established by previous studies. Lymphotoxin was first characterized as a biologic factor in mitogen-stimulated lymphocytes having anticellular activ-

ity on neoplastic cell lines. It is a glycoprotein with a relative molecular mass (Mr) of 60,000–70,000, whereas monomeric lymphotoxin has an Mr of 25,000. Gray et al. (1984) isolated a chemically synthesized gene and natural complementary DNA coding for human lymphotoxin and engineered them for expression in *E. coli*. Cytotoxic and necrosis effects were observed in murine and human tumor cell lines in vitro and in murine sarcomas in vivo. TNF-beta (also known as lymphotoxin-alpha, or LTA) shows 35% identity and 50% homology in amino acid sequence with the TNF-alpha (OMIM Ref. No. 191160). Aggarwal et al. (1985) showed that the 2 TNFs share a common receptor on tumor cells See 191160 for information on the situation of both TNFA and TNFB on 6p. By analysis of deletions induced in lymphoblastoid cells by gamma-irradiation, Evans et al. (1989) concluded that TNFB maps to the interval between C4 and HLA-B. Spies et al. (1989) showed that the TNF-alpha and TNF-beta gene cluster is about 210 kb from HLA-B on 6p21.3. Jongeneel et al. (1991) described polymorphic microsatellites within a 12-kb region of the major histocompatibility complex that includes the TNFB locus. Lymphotoxin-alpha in a homotrimeric form is a soluble protein secreted by activated

lymphocytes and presumed to act as a modulator in the immune response. The LT-alpha homotrimer shares its receptor with tumor necrosis factor and binds to both TNF receptor-1 (OMIM Ref. No. 191190) and -2 (191191

[7091] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7092] Aggarwal, B. B.; Eessalu, T. E.; Hass, P. E. : Characterization of receptors for human tumour necrosis factor and their regulation by gamma-interferon. Nature 318: 665-667, 1985. ; and

[7093] Evans, A. M.; Petersen, J. W.; Sekhon, G. S.; DeMars, R. : Mapping of prolactin and tumor necrosis factor-beta genes on human chromosome 6p using lymphoblastoid cell deletion mutants. Somat.

[7094] Further studies establishing the function and utilities of LTA are found in John Hopkins OMIM database record ID 153440, and in cited publications numbered 137-14 and 834 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032105) is another VGAM235 host target gene. PPP1R12B BINDING SITE is HOST TARGET binding

site found in the 3` untranslated region of mRNA encoded by PPP1R12B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R12B BINDING SITE, designated SEQ ID:2229, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7095] Another function of VGAM235 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 12B (PPP1R12B, Accession NM_032105). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R12B. Trefoil Factor 3 (intestinal) (TFF3, Accession XM_032969) is another VGAM235 host target gene. TFF3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TFF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TFF3 BINDING SITE, designated SEQ ID:2661, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7096] Another function of VGAM235 is therefore inhibition of Trefoil Factor 3 (intestinal) (TFF3, Accession XM_032969), a gene which may have a role in promoting cell migration (motogen). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TFF3. The function of TFF3 has been established by previous studies. Chinery et al. (1996) showed that the TFF3 gene segregates with 21q in a rodent/human somatic cell hybrid panel. By fluorescence in situ hybridization (FISH), they mapped the gene more precisely to 21q22.3. Triple FISH, together with physical mapping of human genomic DNA using pulsed field gel electrophoresis, revealed that the TFF3 gene is tightly linked to those encoding the other known human trefoil peptides, namely the breast cancer estrogen-inducible gene (TFF1; 113710) and spasmolytic protein. Using PCR analysis of a somatic cell hybrid panel and FISH using 2 large genomic recombinants cloned in a bacterial artificial chromosome (BAC), Schmitt et al. (1996) confirmed the mapping of TFF3 to 21q22.3. Seib et al. (1997) found that the TFF1, TFF2, and TFF3 genes are clustered within a 55-kb region. Burmeister and Meyer (1997) demonstrated that the mouse *Tff3* gene maps to chromosome 17. Ani-

mal model experiments lend further support to the function of TFF3. Mashimo et al. (1996) produced mice unable to express the intestinal trefoil factor by means of targeted disruption of the mouse *Itf* gene through homologous recombination. *Itf* $-/-$ mice lacked *Itf* protein in the colon and small intestine, and expression of the other trefoil proteins pS2 (*Tff1*) and SP (*Tff2*) was normal. *Itf* $-/-$ mice developed normally. Mashimo et al. (1996) reported that although the *Itf* $-/-$ mice exhibited normal mucosal architecture, their proliferative intestinal compartments were expanded and there was impaired migration of epithelium to the mucosal surface. The mice were markedly sensitive to the effects of ingested Dextran sulfate sodium (DSS) and this treatment resulted in the presence of multiple sites of ulceration and hemorrhage in colon. Histologic examination revealed large stretches of denuded epithelium and there was no evidence of reepithelization. Colons of most DSS-treated wildtype mice were unaffected. Wildtype mice did display microscopic evidence of mucosal erosion but most of the erosions were small and exhibited features of mucosal healing. Mashimo et al. (1996) demonstrated that repletion of *Itf*-deficient mice by luminal instillation of recombinant *Itf* peptide resulted in heal-

ing. Mashimo et al. (1996) concluded that their findings revealed a central role for Itf in the maintenance and repair of intestinal mucosa. They noted that trefoil factors are unusual in their resistance to acid and proteolytic enzymes, and that they therefore have potential as orally administered therapy for various forms of gastrointestinal injury, including inflammatory bowel disease.

[7097] It is appreciated that the abovementioned animal model for TFF3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7098] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7099] Chinery, R.; Williamson, J.; Poulsom, R. : The gene encoding human intestinal trefoil factor (TFF3) is located on chromosome 21q22.3 clustered with other members of the trefoil peptide family. Genomics 32: 281–284, 1996. ; and

[7100] Mashimo, H.; Wu, D.-C.; Podolsky, D. K.; Fishman, M. C. : Impaired defense of intestinal mucosa in mice lacking intestinal trefoil factor. Science 274: 262–265, 1996.

[7101] Further studies establishing the function and utilities of

TFF3 are found in John Hopkins OMIM database record ID 600633, and in cited publications numbered 1584–1585, 330, 1586–1589, 331, 1590–159 and 1626 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222) is another VGAM235 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:1366, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7102] Another function of VGAM235 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. DKFZP434C1715 (Accession XM_098421) is another VGAM235 host target gene. DKFZP434C1715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by DKFZP434C1715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434C1715 BINDING SITE, designated SEQ ID:3371, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7103] Another function of VGAM235 is therefore inhibition of DKFZP434C1715 (Accession XM_098421). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434C1715. FLJ21075 (Accession NM_025031) is another VGAM235 host target gene. FLJ21075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21075 BINDING SITE, designated SEQ ID:2130, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7104] Another function of VGAM235 is therefore inhibition of FLJ21075 (Accession NM_025031). Accordingly, utilities of

VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21075. FLJ23556 (Accession NM_024880) is another VGAM235 host target gene. FLJ23556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23556 BINDING SITE, designated SEQ ID:2101, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7105] Another function of VGAM235 is therefore inhibition of FLJ23556 (Accession NM_024880). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23556. Hydroxysteroid (17-beta) Dehydrogenase 7 (HSD17B7, Accession NM_016371) is another VGAM235 host target gene. HSD17B7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSD17B7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of HSD17B7 BINDING SITE, designated SEQ ID:1682, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7106] Another function of VGAM235 is therefore inhibition of Hydroxysteroid (17-beta) Dehydrogenase 7 (HSD17B7, Accession NM_016371). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSD17B7. IDN3 (Accession NM_133433) is another VGAM235 host target gene. IDN3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDN3 BINDING SITE, designated SEQ ID:2415, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7107] Another function of VGAM235 is therefore inhibition of IDN3 (Accession NM_133433). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDN3. KIAA1456 (Accession XM_040100) is another VGAM235

host target gene. KIAA1456 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1456, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1456 BINDING SITE, designated SEQ ID:2772, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7108] Another function of VGAM235 is therefore inhibition of KIAA1456 (Accession XM_040100). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1456. Neurexophilin 3 (NXPH3, Accession XM_037847) is another VGAM235 host target gene. NXPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NXPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXPH3 BINDING SITE, designated SEQ ID:2727, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ

ID:570.

[7109] Another function of VGAM235 is therefore inhibition of Neurexophilin 3 (NXPH3, Accession XM_037847). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXPH3. PNPASE (Accession XM_048088) is another VGAM235 host target gene. PNPASE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PNPASE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PNPASE BINDING SITE, designated SEQ ID:2901, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7110] Another function of VGAM235 is therefore inhibition of PNPASE (Accession XM_048088). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNPASE. Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964) is another VGAM235 host target gene. SPRY4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPRY4, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY4 BINDING SITE, designated SEQ ID:2176, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7111] Another function of VGAM235 is therefore inhibition of Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY4. Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession XM_166119) is another VGAM235 host target gene. ZNF33A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF33A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF33A BINDING SITE, designated SEQ ID:3519, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7112] Another function of VGAM235 is therefore inhibition of Zinc Finger Protein 33a (KOX 31) (ZNF33A, Accession

XM_166119). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF33A. LOC126282 (Accession XM_059012) is another VGAM235 host target gene. LOC126282 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126282 BINDING SITE, designated SEQ ID:2999, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7113] Another function of VGAM235 is therefore inhibition of LOC126282 (Accession XM_059012). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126282. LOC144583 (Accession XM_084907) is another VGAM235 host target gene. LOC144583 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC144583 BINDING SITE, designated SEQ ID:3068, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7114] Another function of VGAM235 is therefore inhibition of LOC144583 (Accession XM_084907). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144583. LOC145231 (Accession XM_096740) is another VGAM235 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:3273, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7115] Another function of VGAM235 is therefore inhibition of LOC145231 (Accession XM_096740). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. LOC147837 (Accession XM_085915) is an-

other VGAM235 host target gene. LOC147837 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147837 BINDING SITE, designated SEQ ID:3113, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7116] Another function of VGAM235 is therefore inhibition of LOC147837 (Accession XM_085915). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147837. LOC149910 (Accession XM_086699) is another VGAM235 host target gene. LOC149910 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149910, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149910 BINDING SITE, designated SEQ ID:3141, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7117] Another function of VGAM235 is therefore inhibition of LOC149910 (Accession XM_086699). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149910. LOC158160 (Accession XM_054490) is another VGAM235 host target gene. LOC158160 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158160, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158160 BINDING SITE, designated SEQ ID:2967, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7118] Another function of VGAM235 is therefore inhibition of LOC158160 (Accession XM_054490). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158160. LOC158292 (Accession XM_098914) is another VGAM235 host target gene. LOC158292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158292, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE, designated SEQ ID:3385, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7119] Another function of VGAM235 is therefore inhibition of LOC158292 (Accession XM_098914). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. LOC162333 (Accession XM_102591) is another VGAM235 host target gene. LOC162333 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162333 BINDING SITE, designated SEQ ID:3401, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7120] Another function of VGAM235 is therefore inhibition of LOC162333 (Accession XM_102591). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC162333. LOC200057 (Accession XM_114106) is another VGAM235 host target gene. LOC200057 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200057, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200057 BINDING SITE, designated SEQ ID:3437, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7121] Another function of VGAM235 is therefore inhibition of LOC200057 (Accession XM_114106). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200057. LOC202018 (Accession XM_114420) is another VGAM235 host target gene. LOC202018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202018 BINDING SITE, designated SEQ ID:3460, to the nucleotide sequence of VGAM235 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:570.

[7122] Another function of VGAM235 is therefore inhibition of LOC202018 (Accession XM_114420). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202018. LOC219392 (Accession XM_165921) is another VGAM235 host target gene. LOC219392 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219392 BINDING SITE, designated SEQ ID:3511, to the nucleotide sequence of VGAM235 RNA, herein designated VGAM RNA, also designated SEQ ID:570.

[7123] Another function of VGAM235 is therefore inhibition of LOC219392 (Accession XM_165921). Accordingly, utilities of VGAM235 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219392. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 236 (VGAM236) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7124] VGAM236 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM236 was detected is described hereinabove with reference to Figs. 1–8.

[7125] VGAM236 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7126] VGAM236 gene encodes a VGAM236 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM236 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM236 precursor RNA is designated SEQ ID:222, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:222 is located at position 124655 relative to the genome of Vaccinia Virus.

[7127] VGAM236 precursor RNA folds onto itself, forming

VGAM236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM236 folded precursor RNA into VGAM236 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM236 RNA is designated SEQ ID:571, and is provided hereinbelow with reference to the sequence listing part.

[7129] VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM236 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7130] VGAM236 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM236 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM236 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7131] The complementary binding of VGAM236 RNA, herein designated VGAM RNA, to host target binding sites on VGAM236 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM236 host target RNA into VGAM236 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7132] It is appreciated that VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM236 host target genes. The mRNA of each one of this plurality of VGAM236 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM236 RNA, herein designated VGAM RNA, and which when bound by VGAM236 RNA causes inhibition of translation of respective one or more VGAM236 host target proteins.

[7133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM236 gene, herein designated VGAM GENE, on one or more VGAM236 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7134] It is yet further appreciated that a function of VGAM236 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM236 correlate with, and may be deduced from, the identity of the host target genes which VGAM236 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[7135] Nucleotide sequences of the VGAM236 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM236 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM236 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM236 are further described hereinbelow with reference to Table 1.

[7136] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM236 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM236 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7137] As mentioned hereinabove with reference to Fig. 1, a function of VGAM236 gene, herein designated VGAM is inhibition of expression of VGAM236 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM236 correlate with, and may be deduced from, the identity of the target genes which VGAM236 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[7138] Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283) is a VGAM236 host target gene. TACC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TACC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TACC1 BINDING SITE, designated SEQ ID:1285, to the nucleotide sequence of VGAM236 RNA, herein designated VGAM RNA, also designated SEQ ID:571.

[7139] A function of VGAM236 is therefore inhibition of Transforming, Acidic Coiled-coil Containing Protein 1 (TACC1, Accession NM_006283). Accordingly, utilities of VGAM236 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TACC1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 237 (VGAM237) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7140] VGAM237 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM237 was detected is described hereinabove with reference to Figs. 1–8.

[7141] VGAM237 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7142] VGAM237 gene encodes a VGAM237 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM237 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM237 precursor RNA is designated SEQ ID:223, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:223 is located at position 127745 relative to the genome of Vaccinia Virus.

[7143] VGAM237 precursor RNA folds onto itself, forming VGAM237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7144] An enzyme complex designated DICER COMPLEX, `dices` the VGAM237 folded precursor RNA into VGAM237 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM237 RNA is designated SEQ ID:572, and is provided hereinbelow with reference to the sequence listing part.

[7145] VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM237 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[7146] VGAM237 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM237 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM237 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7147] The complementary binding of VGAM237 RNA, herein designated VGAM RNA, to host target binding sites on VGAM237 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM237 host target RNA into VGAM237 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7148] It is appreciated that VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM237 host target genes. The mRNA of each one of this plurality of VGAM237 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM237 RNA, herein designated VGAM RNA, and which when bound by VGAM237 RNA causes inhibition of translation of respective one or more VGAM237 host target proteins.

[7149] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM237 gene, herein designated VGAM GENE, on one or more VGAM237 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7150] It is yet further appreciated that a function of VGAM237 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM237 correlate

with, and may be deduced from, the identity of the host target genes which VGAM237 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7151] Nucleotide sequences of the VGAM237 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM237 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM237 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM237 are further described hereinbelow with reference to Table 1.

[7152] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM237 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM237 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7153] As mentioned hereinabove with reference to Fig. 1, a function of VGAM237 gene, herein designated VGAM is inhibition of expression of VGAM237 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM237 correlate with, and may be deduced

from, the identity of the target genes which VGAM237 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7154] Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418) is a VGAM237 host target gene. EIF4G2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF4G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF4G2 BINDING SITE, designated SEQ ID:827, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:572.

[7155] A function of VGAM237 is therefore inhibition of Eukaryotic Translation Initiation Factor 4 Gamma, 2 (EIF4G2, Accession NM_001418), a gene which is a repressor of translation. Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF4G2. The function of EIF4G2 has been established by previous studies. Imataka et al. (1997) used immunoprecipitation studies with HA- or FLAG-tagged proteins to show that p97 specifically binds

to EIF4A and EIF3, but not to EIF4E (OMIM Ref. No. 133440) in vitro. Transient transfection experiments showed that p97 suppressed both cap-dependent and independent translation, and that overexpression of p97 reduced overall protein synthesis. Imataka et al. (1997) suggested that p97 is a general repressor of translation that acts by forming translationally inactive complexes. Levy-Strumpf et al. (1997) showed that while a fragment of DAP5 cDNA from the C-terminal region (encoding a 28-kD 'miniprotein') protected cells from IFNG-induced programmed cell death at low levels of expression, higher levels of expression were toxic. They proposed that the miniprotein may be a dominant-negative inhibitor of the essential DAP5 protein, and that DAP5 may play a specific role in apoptosis.

[7156] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7157] Imataka, H.; Olsen, H. S.; Sonenberg. N. : A new translational regulator with homology to eukaryotic translation initiation factor 4G. EMBO J. 16: 817-825, 1997. ; and

[7158] Levy-Strumpf, N.; Deiss, L. P.; Berissi, H.; Kimchi, A. : DAP-5, a novel homolog of eukaryotic translation initia-

tion factor 4G isolated as a putative modulator of gamma interferon-indu.

[7159] Further studies establishing the function and utilities of EIF4G2 are found in John Hopkins OMIM database record ID 602325, and in cited publications numbered 1455–1456, 79 and 1457–1458 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286) is another VGAM237 host target gene. PEX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PEX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PEX12 BINDING SITE, designated SEQ ID:727, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:572.

[7160] Another function of VGAM237 is therefore inhibition of Peroxisomal Biogenesis Factor 12 (PEX12, Accession NM_000286). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PEX12. LOC130162 (Accession XM_059406) is another VGAM237 host target

gene. LOC130162 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC130162, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130162 BINDING SITE, designated SEQ ID:3009, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:572.

[7161] Another function of VGAM237 is therefore inhibition of LOC130162 (Accession XM_059406). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130162. LOC152573 (Accession XM_087488) is another VGAM237 host target gene. LOC152573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152573 BINDING SITE, designated SEQ ID:3172, to the nucleotide sequence of VGAM237 RNA, herein designated VGAM RNA, also designated SEQ ID:572.

[7162] Another function of VGAM237 is therefore inhibition of LOC152573 (Accession XM_087488). Accordingly, utilities of VGAM237 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 238 (VGAM238) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7163] VGAM238 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM238 was detected is described hereinabove with reference to Figs. 1–8.

[7164] VGAM238 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7165] VGAM238 gene encodes a VGAM238 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM238

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM238 precursor RNA is designated SEQ ID:224, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:224 is located at position 126291 relative to the genome of Vaccinia Virus.

[7166] VGAM238 precursor RNA folds onto itself, forming VGAM238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7167] An enzyme complex designated DICER COMPLEX, `dices` the VGAM238 folded precursor RNA into VGAM238 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 85%) nucleotide sequence of VGAM238 RNA is designated SEQ ID:573, and is provided hereinbelow with reference to the sequence listing part.

[7168] VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM238 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7169] VGAM238 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM238 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM238 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7170] The complementary binding of VGAM238 RNA, herein designated VGAM RNA, to host target binding sites on VGAM238 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM238 host target RNA into VGAM238 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7171] It is appreciated that VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM238 host target genes. The mRNA of each one of this plurality of VGAM238 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM238 RNA, herein designated VGAM RNA, and which when bound by VGAM238 RNA causes inhibition of translation of respective one or more VGAM238 host target proteins.

[7172] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM238 gene, herein designated VGAM GENE, on one or more VGAM238 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7173] It is yet further appreciated that a function of VGAM238 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM238 correlate with, and may be deduced from, the identity of the host target genes which VGAM238 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7174] Nucleotide sequences of the VGAM238 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM238 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM238 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM238 are further described hereinbelow with reference to Table 1.

[7175] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM238 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM238 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[7176] As mentioned hereinabove with reference to Fig. 1, a function of VGAM238 gene, herein designated VGAM is inhibition of expression of VGAM238 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM238 correlate with, and may be deduced from, the identity of the target genes which VGAM238 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7177] Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Accession NM_021122) is a VGAM238 host target gene. FACL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FACL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL2 BINDING SITE, designated SEQ ID:1942, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7178] A function of VGAM238 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 2 (FACL2, Accession NM_021122), a gene which activates long-chain fatty acids for both synthesis of cellular lipids. Accordingly,

utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL2. The function of FACL2 has been established by previous studies. See 152425. Minoshima et al. (1991) isolated a human cDNA for a long-chain acyl-CoA synthetase from a human liver cDNA library using the rat cDNA as a probe. Using flow-sorted human chromosomes, they demonstrated that the gene, now designated FACL2, is located on human chromosome 4. Cantu et al. (1995) mapped FACL2 to 4q34-q35 by fluorescence in situ hybridization.

[7179] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7180] Cantu, E. S.; Sprinkle, T. J.; Ghosh, B.; Singh, I. : The human palmitoyl-CoA ligase (FACL2) gene maps to the chromosome 4q34-q35 region by fluorescence in situ hybridization (FISH) and somatic cell hybrid panels. *Genomics* 28: 600-602, 1995. ; and

[7181] Minoshima, S.; Fukuyama, R.; Yamamoto, T.; Shimizu, N. : Mapping of human long-chain acyl-CoA synthetase to chromosome 4. (Abstract) *Cytogenet. Cell Genet.* 58: 1888 only, 1991.

[7182] Further studies establishing the function and utilities of FACL2 are found in John Hopkins OMIM database record ID 152426, and in cited publications numbered 792 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphotriesterase Related (PTER, Accession NM_030664) is another VGAM238 host target gene. PTER BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTER, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTER BINDING SITE, designated SEQ ID:2154, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7183] Another function of VGAM238 is therefore inhibition of Phosphotriesterase Related (PTER, Accession NM_030664), a gene which is a phosphotriesterase homology protein. Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTER. The function of PTER has been established by previous studies. Microbial phosphotriesterases are a group of zinc metalloenzymes that cat-

alyze the hydrolysis of a range of phosphotriester compounds. Davies et al. (1997) isolated rat cDNAs encoding a phosphotriesterase homolog, which they named rpr1. Using a rat rpr1 cDNA as a hybridization probe, Alimova-Kost et al. (1998) isolated human genomic sequences of PTER, a homolog of phosphotriesterases. By FISH, Alimova-Kost et al. (1998) mapped the human PTER gene to 10p12

[7184] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7185] Alimova-Kost, M. V.; Imreh, S.; Buchman, V. L.; Ninkina, N. N. : Assignment of phosphotriesterase-related gene (PTER) to human chromosome band 10p12 by in situ hybridization. Cytogenet. Cell Genet. 83: 16-17, 1998. ; and

[7186] Davies, J. A.; Buchman, V. L.; Krylova, O.; Ninkina, N. N. : Molecular cloning and expression pattern of rpr-1, a resiniferatoxin-binding, phosphotriesterase-related protein, expressed.

[7187] Further studies establishing the function and utilities of PTER are found in John Hopkins OMIM database record ID 604446, and in cited publications numbered 254-255 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. ATPase, H⁺ Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 1 (ATP6V1G1, Accession NM_004888) is another VGAM238 host target gene. ATP6V1G1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1G1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1G1 BINDING SITE, designated SEQ ID:1163, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7188] Another function of VGAM238 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal 13kDa, V1 Subunit G Isoform 1 (ATP6V1G1, Accession NM_004888). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1G1. GFR (Accession NM_012294) is another VGAM238 host target gene. GFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of GFR BINDING SITE, designated SEQ ID:1423, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7189] Another function of VGAM238 is therefore inhibition of GFR (Accession NM_012294). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GFR. KIAA0349 (Accession XM_166449) is another VGAM238 host target gene. KIAA0349 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0349, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0349 BINDING SITE, designated SEQ ID:3562, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7190] Another function of VGAM238 is therefore inhibition of KIAA0349 (Accession XM_166449). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0349. Regulator of G-protein Signalling 20 (RGS20,

Accession NM_003702) is another VGAM238 host target gene. RGS20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS20 BINDING SITE, designated SEQ ID:1049, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7191] Another function of VGAM238 is therefore inhibition of Regulator of G-protein Signalling 20 (RGS20, Accession NM_003702). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS20. LOC253573 (Accession XM_173110) is another VGAM238 host target gene. LOC253573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253573 BINDING SITE, designated SEQ ID:3725, to the nucleotide sequence of

VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7192] Another function of VGAM238 is therefore inhibition of LOC253573 (Accession XM_173110). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253573. LOC83690 (Accession NM_031461) is another VGAM238 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:2203, to the nucleotide sequence of VGAM238 RNA, herein designated VGAM RNA, also designated SEQ ID:573.

[7193] Another function of VGAM238 is therefore inhibition of LOC83690 (Accession NM_031461). Accordingly, utilities of VGAM238 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 239 (VGAM239) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7194] VGAM239 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM239 was detected is described hereinabove with reference to Figs. 1–8.

[7195] VGAM239 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7196] VGAM239 gene encodes a VGAM239 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM239 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM239 precursor RNA is designated SEQ ID:225, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:225 is located at position 127132 relative to the genome of Vaccinia Virus.

[7197] VGAM239 precursor RNA folds onto itself, forming VGAM239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7198] An enzyme complex designated DICER COMPLEX, `dices` the VGAM239 folded precursor RNA into VGAM239 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide sequence of VGAM239 RNA is designated SEQ ID:574, and is provided hereinbelow with reference to the sequence listing part.

[7199] VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM239 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM239 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7200] VGAM239 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM239 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM239 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7201] The complementary binding of VGAM239 RNA, herein designated VGAM RNA, to host target binding sites on VGAM239 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM239 host target RNA into VGAM239 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7202] It is appreciated that VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM239 host target genes. The mRNA of each one of this plurality of VGAM239 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM239 RNA, herein designated VGAM RNA, and which when bound by VGAM239 RNA causes inhibition of translation of respective one or more VGAM239 host target proteins.

[7203] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM239 gene, herein designated VGAM GENE, on one or more VGAM239 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7204] It is yet further appreciated that a function of VGAM239 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM239 correlate with, and may be deduced from, the identity of the host

target genes which VGAM239 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7205] Nucleotide sequences of the VGAM239 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM239 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM239 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM239 are further described hereinbelow with reference to Table 1.

[7206] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM239 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM239 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7207] As mentioned hereinabove with reference to Fig. 1, a function of VGAM239 gene, herein designated VGAM is inhibition of expression of VGAM239 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM239 correlate with, and may be deduced from, the identity of the target genes which VGAM239

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7208] RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105) is a VGAM239 host target gene. RBM8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM8A BINDING SITE, designated SEQ ID:1186, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:574.

[7209] A function of VGAM239 is therefore inhibition of RNA Binding Motif Protein 8A (RBM8A, Accession NM_005105), a gene which involves in the pathway of gene expression postsplicing nuclear preexport mRNPs, and newly exported cytoplasmic mRNPs. Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM8A. The function of RBM8A has been established by previous studies. Mago nashi (MAGOH; 602603), meaning grandchildless, is the homolog of a Drosophila protein required for normal germ plasm development in fly embryos. By

performing a yeast 2-hybrid screen on a fetal brain cDNA library with MAGOH as the bait, Zhao et al. (2000) recovered a cDNA encoding RBM8. The 173-amino acid RBM8 protein is more than 93% identical to the mouse and zebrafish sequences, and the mouse differences are all accounted for by an 11-amino acid N-terminal insertion and another single-residue insertion in the mouse sequence. Exchange partner and GST pull-down assays confirmed the MAGOH-RBM8 interaction and showed that RBM8 is expressed as a 26-kD protein, slightly larger than the predicted mass of 23 kD. Northern blot analysis detected a major RBM8 transcript of less than 1.0 kb in all tissues tested, with weakest expression in pancreas and brain. By searching an EST database for homologs of the gonadotropin-releasing hormone receptor (GNRHR; 138850), followed by 5-prime RACE on a skeletal muscle cDNA library, Conklin et al. (2000) identified a cDNA encoding RBM8. Northern blot analysis detected a major 0.9-kb transcript in all tissues tested. Sequence analysis of the 174-amino acid protein predicted an RNA-binding domain, which is composed of 2 amphipathic alpha helices packed against a 4-stranded beta sheet, and a C-terminal arg-rich segment.

- [7210] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [7211] Conklin, D. C.; Rixon, M. W.; Kuestner, R. E.; Maurer, M. F.; Whitmore, T. E.; Millar, R. P. : Cloning and gene expression of a novel human ribonucleoprotein. *Biochim. Biophys. Acta* 1492: 465–469, 2000. ; and
- [7212] Zhao, X.-F.; Nowak, N. J.; Shows, T. B.; Aplan, P. D. : MAGOH interacts with a novel RNA-binding protein. *Genomics* 63: 145–148, 2000.
- [7213] Further studies establishing the function and utilities of RBM8A are found in John Hopkins OMIM database record ID 605313, and in cited publications numbered 1674–1677 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM239 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A6

BINDING SITE, designated SEQ ID:1078, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:574.

[7214] Another function of VGAM239 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM48.Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431) is another VGAM239 host target gene. SEMA3E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA3E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3E BINDING SITE, designated SEQ ID:1432, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM

RNA, also designated SEQ ID:574.

[7215] Another function of VGAM239 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3E (SEMA3E, Accession NM_012431). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3E. LOC151201 (Accession XM_098021) is another VGAM239 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:3339, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:574.

[7216] Another function of VGAM239 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. LOC90979 (Accession XM_035323) is another VGAM239 host target gene. LOC90979 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90979, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90979 BINDING SITE, designated SEQ ID:2692, to the nucleotide sequence of VGAM239 RNA, herein designated VGAM RNA, also designated SEQ ID:574.

[7217] Another function of VGAM239 is therefore inhibition of LOC90979 (Accession XM_035323). Accordingly, utilities of VGAM239 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90979. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 240 (VGAM240) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7218] VGAM240 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM240 was detected is described hereinabove with reference to Figs. 1-8.

[7219] VGAM240 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7220] VGAM240 gene encodes a VGAM240 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM240 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM240 precursor RNA is designated SEQ ID:226, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:226 is located at position 129602 relative to the genome of Vaccinia Virus.

[7221] VGAM240 precursor RNA folds onto itself, forming VGAM240 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[7222] An enzyme complex designated DICER COMPLEX, `dices` the VGAM240 folded precursor RNA into VGAM240 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM240 RNA is designated SEQ ID:575, and is provided hereinbelow with reference to the sequence listing part.

[7223] VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM240 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7224] VGAM240 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM240 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM240 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM240 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7225] The complementary binding of VGAM240 RNA, herein designated VGAM RNA, to host target binding sites on VGAM240 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM240 host target RNA into VGAM240 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7226] It is appreciated that VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM240 host target genes. The mRNA of each one of this plurality of VGAM240 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM240 RNA, herein designated VGAM RNA, and which when bound by VGAM240 RNA causes inhibition of translation of respective one or more VGAM240 host target proteins.

[7227] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM240 gene, herein designated VGAM GENE, on one or more VGAM240 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7228] It is yet further appreciated that a function of VGAM240 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM240 correlate with, and may be deduced from, the identity of the host target genes which VGAM240 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7229] Nucleotide sequences of the VGAM240 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM240 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM240 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM240 are further described hereinbelow with reference to Table 1.

[7230] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM240 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM240 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7231] As mentioned hereinabove with reference to Fig. 1, a function of VGAM240 gene, herein designated VGAM is inhibition of expression of VGAM240 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM240 correlate with, and may be deduced from, the identity of the target genes which VGAM240 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7232] Zic Family Member 1 (odd-paired homolog, Drosophila) (ZIC1, Accession NM_003412) is a VGAM240 host target gene. ZIC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of ZIC1 BINDING SITE, designated SEQ ID:1017, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:575.

[7233] A function of VGAM240 is therefore inhibition of Zic Family Member 1 (odd-paired homolog, *Drosophila*) (ZIC1, Accession NM_003412), a gene which may play a role in cerebellar development. Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIC1. The function of ZIC1 has been established by previous studies. mouse cerebellum and is highly homologous to the *Drosophila* pair-rule gene Opa. To clarify the mechanism for the development of the human cerebellum and the possible involvement of ZIC in human nervous system diseases, Yokota et al. (1996) isolated human ZIC cDNA and examined its expression by using monoclonal antibody against recombinant ZIC protein. The nucleotide sequence of human ZIC cDNA is 85% homologous to that the mouse zic gene. Its putative amino acid sequence is highly conserved (more than 99%) except for substitution of only 2 amino acid residues. By fluorescence in situ hybridization, Yokota et al. (1996) mapped the human ZIC gene to 3q24.

The human ZIC protein was immunohistochemically detected in the nuclei of the cerebellar granule cell lineage from the progenitor cells of the external germinal layer to the postmigrated cells of the internal granular layer. Furthermore, ZIC protein was detected in medulloblastoma (26 of 29 cases), whereas none of 70 other tumors examined, including primitive neuroectodermal tumors, expressed this protein. These findings suggested that ZIC is a potential biomarker for medulloblastoma as well as the human cerebellar granule cell lineage.

[7234] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7235] Aruga, J.; Yokota, N.; Hashimoto, M.; Furuichi, T.; Fukuda, M.; Mikoshiba, K. : A novel zinc finger protein, Zic, is involved in neurogenesis, especially in the cell lineage of cerebellar granule cells. *J. Neurochem.* 63: 1880–1890, 1994. ; and

[7236] Yokota, N.; Aruga, J.; Takai, S.; Yamada, K.; Hamazaki, M.; Iwase, T.; Sugimura, H.; Mikoshiba, K. : Predominant expression of human Zic in cerebellar granule cell lineage and medulloblasto.

[7237] Further studies establishing the function and utilities of

ZIC1 are found in John Hopkins OMIM database record ID 600470, and in cited publications numbered 1764–1766 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1550 (Accession XM_039393) is another VGAM240 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:2752, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:575.

[7238] Another function of VGAM240 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. LOC143720 (Accession XM_017350) is another VGAM240 host target gene. LOC143720 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143720, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143720 BINDING SITE, designated SEQ ID:2568, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:575.

[7239] Another function of VGAM240 is therefore inhibition of LOC143720 (Accession XM_017350). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143720. LOC150848 (Accession XM_097959) is another VGAM240 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:3335, to the nucleotide sequence of VGAM240 RNA, herein designated VGAM RNA, also designated SEQ ID:575.

[7240] Another function of VGAM240 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM240 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150848. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 241 (VGAM241) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7241] VGAM241 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM241 was detected is described hereinabove with reference to Figs. 1–8.

[7242] VGAM241 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7243] VGAM241 gene encodes a VGAM241 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM241 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM241 precursor RNA is designated SEQ ID:227, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:227 is located at position 130612 relative to the genome of Vaccinia Virus.

[7244] VGAM241 precursor RNA folds onto itself, forming VGAM241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7245] An enzyme complex designated DICER COMPLEX, `dices` the VGAM241 folded precursor RNA into VGAM241 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM241 RNA is designated SEQ ID:576, and is provided hereinbelow with reference to the sequence listing part.

[7246] VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM241 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7247] VGAM241 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM241 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM241 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7248] The complementary binding of VGAM241 RNA, herein designated VGAM RNA, to host target binding sites on VGAM241 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM241 host target RNA into VGAM241 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7249] It is appreciated that VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM241 host target genes. The mRNA of each one of this plurality of VGAM241 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM241 RNA, herein designated VGAM RNA, and which when bound by VGAM241 RNA causes in-

hibition of translation of respective one or more VGAM241 host target proteins.

[7250] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM241 gene, herein designated VGAM GENE, on one or more VGAM241 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7251] It is yet further appreciated that a function of VGAM241 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM241 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM241 correlate with, and may be deduced from, the identity of the host target genes which VGAM241 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [7252] Nucleotide sequences of the VGAM241 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM241 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM241 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM241 are further described hereinbelow with reference to Table 1.
- [7253] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM241 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM241 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [7254] As mentioned hereinabove with reference to Fig. 1, a function of VGAM241 gene, herein designated VGAM is inhibition of expression of VGAM241 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM241 correlate with, and may be deduced from, the identity of the target genes which VGAM241 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7255] MAIL (Accession NM_031419) is a VGAM241 host target gene. MAIL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MAIL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAIL BINDING SITE, designated SEQ ID:2194, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:576.

[7256] A function of VGAM241 is therefore inhibition of MAIL (Accession NM_031419). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAIL. LOC151414 (Accession XM_087197) is another VGAM241 host target gene. LOC151414 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151414 BINDING SITE, designated SEQ ID:3157, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:576.

[7257] Another function of VGAM241 is therefore inhibition of LOC151414 (Accession XM_087197). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151414. LOC155038 (Accession XM_088130) is another VGAM241 host target gene. LOC155038 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155038, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155038 BINDING SITE, designated SEQ ID:3197, to the nucleotide sequence of VGAM241 RNA, herein designated VGAM RNA, also designated SEQ ID:576.

[7258] Another function of VGAM241 is therefore inhibition of LOC155038 (Accession XM_088130). Accordingly, utilities of VGAM241 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC155038. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 242 (VGAM242) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7259] VGAM242 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM242 was detected is described hereinabove with reference to Figs. 1–8.

[7260] VGAM242 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7261] VGAM242 gene encodes a VGAM242 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM242 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM242 precursor RNA is designated SEQ ID:228, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:228 is located at position 131407 relative to the genome of Vaccinia Virus.

[7262] VGAM242 precursor RNA folds onto itself, forming VGAM242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7263] An enzyme complex designated DICER COMPLEX, `dices` the VGAM242 folded precursor RNA into VGAM242 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM242 RNA is designated SEQ ID:577, and is provided hereinbelow with reference to the sequence listing part.

[7264] VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM242 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7265] VGAM242 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM242 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM242 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7266] The complementary binding of VGAM242 RNA, herein designated VGAM RNA, to host target binding sites on VGAM242 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM242 host target RNA into VGAM242 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7267] It is appreciated that VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM242 host target genes. The mRNA of each one of this plurality of VGAM242 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM242 RNA, herein designated VGAM RNA, and which when bound by VGAM242 RNA causes in-

hibition of translation of respective one or more VGAM242 host target proteins.

[7268] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM242 gene, herein designated VGAM GENE, on one or more VGAM242 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7269] It is yet further appreciated that a function of VGAM242 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM242 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM242 correlate with, and may be deduced from, the identity of the host target genes which VGAM242 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [7270] Nucleotide sequences of the VGAM242 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM242 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM242 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM242 are further described hereinbelow with reference to Table 1.
- [7271] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM242 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM242 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [7272] As mentioned hereinabove with reference to Fig. 1, a function of VGAM242 gene, herein designated VGAM is inhibition of expression of VGAM242 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM242 correlate with, and may be deduced from, the identity of the target genes which VGAM242 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7273] Corticotropin Releasing Hormone (CRH, Accession NM_000756) is a VGAM242 host target gene. CRH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRH BINDING SITE, designated SEQ ID:772, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7274] A function of VGAM242 is therefore inhibition of Corticotropin Releasing Hormone (CRH, Accession NM_000756), a gene which regulates the release of corticotropin from pituitary gland. Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRH. The function of CRH has been established by previous studies. Response to stress in mammals requires an intact hy-

pothalamic–pituitary–adrenal axis. The proximal part of the response is mediated by secretion of corticotropin–releasing hormone (CRH) by the paraventricular nucleus of the hypothalamus. CRH is a 41–amino acid peptide derived by enzymatic cleavage from a 191–amino acid preprohormone. Shibahara et al. (1983) cloned and sequenced the human CRH gene. Arbiser et al. (1988) assigned the gene for CRH to 8q13 by somatic cell hybrid and in situ hybridization studies. The absence of secondary hybridization strongly suggested that hypothalamic and placental CRH are transcribed from the same gene. Kellogg et al. (1989) corroborated the assignment to 8q13 by in situ hybridization. Knapp et al. (1993) showed that the homologous gene is located on mouse chromosome 3. Sebaceous glands may be involved in a pathway conceptually similar to that of the hypothalamic–pituitary–adrenal (HPA) axis. CRH is the most proximal element of the HPA axis, and it acts as a central coordinator for neuroendocrine and behavioral responses to stress. To examine the probability of an HPA equivalent pathway in sebaceous glands, Zouboulis et al. (2002) investigated the expression of CRH, CRH–binding protein, CRHBP (OMIM Ref. No. 122559), and CRH receptors (CRHR1, 122561 and CRHR2,

602034) in sebocytes in vitro and their regulation by CRH and several other hormones. CRHR1 was the predominant type, being twice as abundant as CRHR2. CRH was biologically active on human sebocytes; it induced biphasic increase in synthesis of sebaceous lipids, although it did not affect cell viability, cell proliferation, or IL1B (OMIM Ref. No. 147720)–induced IL8 (OMIM Ref. No. 146930) release. Zouboulis et al. (2002) interpreted these and other findings as indicating that CRH may be an autocrine hormone for human sebocytes that exerts homeostatic lipogenic activity, whereas testosterone and growth hormone induced CRH negative feedback. The findings implicated CRH in the clinical development of acne, seborrhea, androgenetic alopecia, skin aging, xerosis, and other skin disorders associated with alterations in lipid formation of sebaceous origin Animal model experiments lend further support to the function of CRH. In adult male rhesus macaques, Habib et al. (2000) evaluated the effects of a lipophilic nonpeptide antagonist to CRH type 1 receptor, antalarmin, on the behavioral, neuroendocrine, and autonomic components of the stress response. After oral administration, significant antalarmin concentrations were detected in the systemic circulation and the cerebrospinal

fluid. The monkeys were exposed to an intense social stressor, namely, placement of 2 unfamiliar males in adjacent cages separated only by a transparent Plexiglas screen. Antalarmin significantly inhibited a repertoire of behaviors associated with anxiety and fear, such as body tremors, grimacing, teeth gnashing, urination, and defecation. In contrast, antalarmin increased exploratory and sexual behaviors that are normally suppressed during stress. Moreover, antalarmin significantly diminished the increases in cerebrospinal fluid CRH as well as the pituitary-adrenal, sympathetic, and adrenal medullary responses to stress. Habib et al. (2000) suggested that a CRH type 1 receptor antagonist may be of therapeutic value in human psychiatric, reproductive, and cardiovascular disorders associated with CRH system hyperactivity.

[7275] It is appreciated that the abovementioned animal model for CRH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7276] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7277] Knapp, L. T.; Keegan, C. E.; Seasholtz, A. F.; Camper, S. A.

: Corticotropin-releasing hormone (Crh) maps to mouse chromosome 3. Mammalian Genome 4: 615–617, 1993. ; and

[7278] Habib, K. E.; Weld, K. P.; Rice, K. C.; Pushkas, J.; Champoux, M.; Listwak, S.; Webster, E. L.; Atkinson, A. J.; Schulkin, J.; Contoreggi, C.; Chrousos, G. P.; McCann, S. M.; Suomi, S. J.

[7279] Further studies establishing the function and utilities of CRH are found in John Hopkins OMIM database record ID 122560, and in cited publications numbered 42 and 457–440 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966) is another VGAM242 host target gene. C1orf24 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf24, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf24 BINDING SITE, designated SEQ ID:2351, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7280] Another function of VGAM242 is therefore inhibition of Chromosome 1 Open Reading Frame 24 (C1orf24, Accession NM_052966). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf24. Chromosome 21 Open Reading Frame 67 (C21orf67, Accession NM_058188) is another VGAM242 host target gene. C21orf67 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C21orf67, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf67 BINDING SITE, designated SEQ ID:2367, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7281] Another function of VGAM242 is therefore inhibition of Chromosome 21 Open Reading Frame 67 (C21orf67, Accession NM_058188). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf67. KIAA0940 (Accession NM_014912) is another VGAM242 host target gene. KIAA0940 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA0940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0940 BINDING SITE, designated SEQ ID:1585, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7282] Another function of VGAM242 is therefore inhibition of KIAA0940 (Accession NM_014912). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0940. LOC158722 (Accession XM_088653) is another VGAM242 host target gene. LOC158722 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158722 BINDING SITE, designated SEQ ID:3225, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7283] Another function of VGAM242 is therefore inhibition of

LOC158722 (Accession XM_088653). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158722. LOC220705 (Accession XM_166000) is another VGAM242 host target gene. LOC220705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220705 BINDING SITE, designated SEQ ID:3514, to the nucleotide sequence of VGAM242 RNA, herein designated VGAM RNA, also designated SEQ ID:577.

[7284] Another function of VGAM242 is therefore inhibition of LOC220705 (Accession XM_166000). Accordingly, utilities of VGAM242 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220705. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 243 (VGAM243) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[7285] VGAM243 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM243 was detected is described hereinabove with reference to Figs. 1–8.

[7286] VGAM243 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7287] VGAM243 gene encodes a VGAM243 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM243 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM243 precursor RNA is designated SEQ ID:229, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:229 is located at position 135663 relative to the genome of Vaccinia Virus.

[7288] VGAM243 precursor RNA folds onto itself, forming VGAM243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[7289] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM243 folded precursor RNA into VGAM243 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 77%) nucleotide se-
quence of VGAM243 RNA is designated SEQ ID:578, and is
provided hereinbelow with reference to the sequence list-
ing part.

[7290] VGAM243 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM243 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM243 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7291] VGAM243 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM243 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM243 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[7292] The complementary binding of VGAM243 RNA, herein designated VGAM RNA, to host target binding sites on VGAM243 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM243 host target RNA into VGAM243 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7293] It is appreciated that VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM243 host target genes. The mRNA of each one of this plurality of VGAM243 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM243 RNA, herein designated VGAM RNA, and which when bound by VGAM243 RNA causes inhibition of translation of respective one or more VGAM243 host target proteins.

[7294] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM243 gene, herein designated VGAM GENE, on one or

more VGAM243 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7295] It is yet further appreciated that a function of VGAM243 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM243 correlate with, and may be deduced from, the identity of the host target genes which VGAM243 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [7296] Nucleotide sequences of the VGAM243 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM243 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM243 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM243 are further described hereinbelow with reference to Table 1.
- [7297] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM243 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM243 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [7298] As mentioned hereinabove with reference to Fig. 1, a function of VGAM243 gene, herein designated VGAM is inhibition of expression of VGAM243 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM243 correlate with, and may be deduced from, the identity of the target genes which VGAM243 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [7299] Activin A Receptor, Type I (ACVR1, Accession NM_001105)

is a VGAM243 host target gene. ACVR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACVR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACVR1 BINDING SITE, designated SEQ ID:800, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7300] A function of VGAM243 is therefore inhibition of Activin A Receptor, Type I (ACVR1, Accession NM_001105), a gene which Activin receptor-like kinase; similar to activin, TGF-beta, and C. elegans daf-1 receptors. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACVR1. The function of ACVR1 has been established by previous studies. See ACVRLK1 (OMIM Ref. No. 601284). Although activins were discovered by virtue of their capacity to stimulate the production of follicle-stimulating hormone (FSH; 136530) by the pituitary gland and inhibins were initially characterized as FSH inhibitors, activins and inhibins are dimeric proteins that share a common subunit. There are 3 activins (A, B, and A-B), comprising different

combinations of 2 closely related beta subunits (beta-A/beta-A; beta-B/beta-B; and beta-A/beta-B, respectively) and 2 inhibins (A and B), consisting of 1 beta-subunit and an inhibin-specific alpha subunit (alpha/beta-A and alpha/beta-B). Activins impinge on a much broader spectrum of cells than do inhibins; however, in those systems in which both proteins are functional, they have opposing biologic effects. Activins are members of a family of polypeptide growth factors that includes also the transforming growth factors-beta (190180, 190220, 190230), mullerian duct-inhibiting substance, and several bone morphogenetic proteins. Human cDNA clones encoding 4 putative transmembrane ser/thr kinases were identified by ten Dijke et al. (1993). By Southern blot analysis of DNAs from a somatic cell hybrid mapping panel, Roijer et al. (1998) mapped the ACVR1 gene to chromosome 2. By fluorescence in situ hybridization, they regionalized the gene to 2q23-q24.

[7301] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7302] ten Dijke, P.; Ichijo, H.; Franzen, P.; Schulz, P.; Saras, J.; Toyoshima, H.; Heldin, C.-H.; Miyazono, K. : Activin re-

ceptor-like kinases: a novel subclass of cell-surface receptors with predicted serine/threonine kinase activity.

Oncogene 8: 2879-2887, 1993. ; and

[7303] Roijer, E.; Miyazono, K.; Astrom, A.-K.; Geurts van Kessel, A.; ten Dijke, P.; Stenman, G. : Chromosomal localization of three human genes encoding members of the TGF-beta superfamily of.

[7304] Further studies establishing the function and utilities of ACVR1 are found in John Hopkins OMIM database record ID 102576, and in cited publications numbered 944-948 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246) is another VGAM243 host target gene. CELSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR1 BINDING SITE, designated SEQ ID:1486, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7305] Another function of VGAM243 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 1 (flamingo homolog, Drosophila) (CELSR1, Accession NM_014246), a gene which is involved in contact-mediated communication. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR1. The function of CELSR1 has been established by previous studies. By screening a mouse embryonic cDNA library, Hadjantonakis et al. (1997, 1998) obtained a cDNA encoding a 3,034-amino acid 7-pass transmembrane G protein-coupled receptor, which they termed cadherin EGF LAG seven-pass G-type receptor-1 (OMIM Ref. No. Celsr1). Celsr1 contains motifs that are recognized as mediators of protein-protein interactions. In its extracellular region it has a block of contiguous cadherin repeats in the N terminus and then a region with 7 epidermal growth factor (EGF; 131530)-like repeats interrupted by 2 laminin A (OMIM Ref. No. 150320) G-type (LAG) repeats. By in situ hybridization and RT-PCR analysis, Hadjantonakis et al. (1997) detected significant levels of Celsr1 in neural tube, brain, lung epithelium, and nascent eyelid in day 11.5 mouse embryos. In adult mice, expression was detected in

spinal cord, eye, and brain, chiefly in ependymal cells lining the lateral, third, and fourth ventricles. The structure, putative G-linked signaling properties, and restricted expression of the Celsr1 protein suggest that it is a receptor involved in contact-mediated communication.

[7306] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7307] Hadjantonakis, A.-K.; Formstone, C. J.; Little, P. F. R. : mCelsr1 is an evolutionarily conserved seven-pass transmembrane receptor and is expressed during mouse embryonic development. *Mech. Dev.* 78: 91-95, 1998. ; and

[7308] Hadjantonakis, A.-K.; Sheward, W. J.; Harmar, A. J.; de Galan, L.; Hoovers, J. M. N.; Little, P. F. R. : Celsr1, a neural-specific gene encoding an unusual seven-pass transmembrane rece.

[7309] Further studies establishing the function and utilities of CELSR1 are found in John Hopkins OMIM database record ID 604523, and in cited publications numbered 1600-160 and 1673 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165) is another VGAM243 host target

gene. GJA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GJA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA1 BINDING SITE, designated SEQ ID:715, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7310] Another function of VGAM243 is therefore inhibition of Gap Junction Protein, Alpha 1, 43kDa (connexin 43) (GJA1, Accession NM_000165), a gene which may act in synchronizing heart contraction and embryonic development. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA1. The function of GJA1 has been established by previous studies. The migration of lymphocytes from the circulation into tissues involves a number of adhesion molecules and the expression of new molecules. Gap junctions facilitate cell-to-cell adhesion and provide pathways for direct intercellular communication. Oviedo-Orta et al. (2000) noted that GJA1 is expressed in a number of lymphoid organs. By RT-PCR, Western blot, and flow cytometric analyses, they showed that lymphocytes

express GJA1 and GJA5 (OMIM Ref. No. 121013), but not GJB2 (OMIM Ref. No. 121011), GJB1 (OMIM Ref. No. 304040), GJA4 (OMIM Ref. No. 121012), or GJA7; GJA5 expression was restricted to tonsillar T and B lymphocytes. Flow cytometric analysis showed that GJA1 and GJA5 expression increases after mitogenic stimulation. Extracellular connexin mimetic peptide blocked dye transfer between lymphocyte subpopulations, and gap junction inhibitors decreased the production of IgM in cocultured T and B lymphocytes. The results identified gap junction proteins as important cell surface components that modulate immune responses. Animal model experiments lend further support to the function of GJA1. By targeted mutagenesis of connexin-43, Reaume et al. (1995) showed that its absence was compatible with survival of mouse embryos to term, even though cell lines mutant in Cx43 showed reduced dye coupling in vitro as assessed by injection of carboxyfluorescein. The latter test indicated a reduction, but not complete absence, of junctional communication. However, mutant embryos died at birth as a result of a failure in pulmonary gas exchange caused by a swelling and blockage of the right ventricular outflow tract from the heart. Reaume et al. (1995) interpreted this find-

ing as indicating that Cx43 plays an essential role in heart development but that there is functional compensation among connexins in other parts of the developing fetus.

[7311] It is appreciated that the abovementioned animal model for GJA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7312] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7313] Oviedo-Orta, E.; Hoy, T.; Evans, W. H. : Intercellular communication in the immune system: differential expression of connexin40 and 43, and perturbation of gap junction channel functions in peripheral blood and tonsil human lymphocyte subpopulations. Immunology 99: 578-590, 2000. ; and

[7314] Reaume, A. G.; de Sousa, P. A.; Kulkarni, S.; Langille, B. L.; Zhu, D.; Davies, T. C.; Juneja, S. C.; Kidder, G. M.; Rossant, J. : Cardiac malformation in neonatal mice lacking connex.

[7315] Further studies establishing the function and utilities of GJA1 are found in John Hopkins OMIM database record ID 121014, and in cited publications numbered 2736-2741, 2788, 18-21, 2818-24, 2735-27, 27-2 and 2734 listed

in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholamban (PLN, Accession NM_002667) is another VGAM243 host target gene. PLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLN BINDING SITE, designated SEQ ID:945, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7316] Another function of VGAM243 is therefore inhibition of Phospholamban (PLN, Accession NM_002667), a gene which regulates the activity of the calcium pump of cardiac sarcoplasmic reticulum. Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLN. The function of PLN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM104. CCR4-NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_054026) is another VGAM243 host target gene. CNOT7 BINDING SITE is HOST TARGET bind-

ing site found in the 3' untranslated region of mRNA encoded by CNOT7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNOT7 BINDING SITE, designated SEQ ID:2363, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7317] Another function of VGAM243 is therefore inhibition of CCR4–NOT Transcription Complex, Subunit 7 (CNOT7, Accession NM_054026). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNOT7. Grcc9 (Accession NM_032641) is another VGAM243 host target gene. Grcc9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Grcc9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Grcc9 BINDING SITE, designated SEQ ID:2268, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7318] Another function of VGAM243 is therefore inhibition of

Grcc9 (Accession NM_032641). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Grcc9. KIAA1287 (Accession XM_085753) is another VGAM243 host target gene. KIAA1287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1287 BINDING SITE, designated SEQ ID:3106, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7319] Another function of VGAM243 is therefore inhibition of KIAA1287 (Accession XM_085753). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1287. KIAA1673 (Accession XM_047672) is another VGAM243 host target gene. KIAA1673 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1673, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1673 BINDING SITE, designated SEQ ID:2894, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7320] Another function of VGAM243 is therefore inhibition of KIAA1673 (Accession XM_047672). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1673. Lipoma HMGIC Fusion Partner (LHFP, Accession NM_005780) is another VGAM243 host target gene. LHFP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LHFP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LHFP BINDING SITE, designated SEQ ID:1248, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7321] Another function of VGAM243 is therefore inhibition of Lipoma HMGIC Fusion Partner (LHFP, Accession NM_005780). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LHFP. Phosphodiesterase

10A (PDE10A, Accession NM_006661) is another VGAM243 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:1320, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7322] Another function of VGAM243 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. TBDN100 (Accession NM_025085) is another VGAM243 host target gene. TBDN100 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TBDN100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TBDN100 BINDING SITE, designated SEQ ID:2135, to the nucleotide sequence of VGAM243 RNA,

herein designated VGAM RNA, also designated SEQ ID:578.

[7323] Another function of VGAM243 is therefore inhibition of TBDN100 (Accession NM_025085). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TBDN100. LOC149448 (Accession XM_097642) is another VGAM243 host target gene. LOC149448 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149448, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149448 BINDING SITE, designated SEQ ID:3310, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7324] Another function of VGAM243 is therefore inhibition of LOC149448 (Accession XM_097642). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149448. LOC155434 (Accession XM_098723) is another VGAM243 host target gene. LOC155434 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC155434, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155434 BINDING SITE, designated SEQ ID:3375, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7325] Another function of VGAM243 is therefore inhibition of LOC155434 (Accession XM_098723). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155434. LOC221583 (Accession XM_166396) is another VGAM243 host target gene. LOC221583 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221583, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221583 BINDING SITE, designated SEQ ID:3557, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7326] Another function of VGAM243 is therefore inhibition of LOC221583 (Accession XM_166396). Accordingly, utilities

of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221583. LOC54466 (Accession NM_019003) is another VGAM243 host target gene. LOC54466 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC54466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC54466 BINDING SITE, designated SEQ ID:1871, to the nucleotide sequence of VGAM243 RNA, herein designated VGAM RNA, also designated SEQ ID:578.

[7327] Another function of VGAM243 is therefore inhibition of LOC54466 (Accession NM_019003). Accordingly, utilities of VGAM243 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC54466. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 244 (VGAM244) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7328] VGAM244 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM244 was detected is described hereinabove with reference to Figs. 1–8.

[7329] VGAM244 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7330] VGAM244 gene encodes a VGAM244 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM244 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM244 precursor RNA is designated SEQ ID:230, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:230 is located at position 134932 relative to the genome of Vaccinia Virus.

[7331] VGAM244 precursor RNA folds onto itself, forming VGAM244 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[7332] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM244 folded precursor RNA into VGAM244 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM244 RNA is designated SEQ ID:579, and is provided hereinbelow with reference to the sequence listing part.

[7333] VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM244 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[7334] VGAM244 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM244 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM244 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7335] The complementary binding of VGAM244 RNA, herein designated VGAM RNA, to host target binding sites on VGAM244 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM244 host target RNA into VGAM244 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7336] It is appreciated that VGAM244 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM244 host target genes. The mRNA of each one of this plurality of VGAM244 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM244 RNA, herein designated VGAM RNA, and which when bound by VGAM244 RNA causes inhibition of translation of respective one or more VGAM244 host target proteins.

[7337] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM244 gene, herein designated VGAM GENE, on one or more VGAM244 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7338] It is yet further appreciated that a function of VGAM244 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM244 correlate with, and may be deduced from, the identity of the host target genes which VGAM244 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7339] Nucleotide sequences of the VGAM244 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM244 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM244 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM244 are further
described hereinbelow with reference to Table 1.

[7340] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM244 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM244 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[7341] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM244 gene, herein designated VGAM is
inhibition of expression of VGAM244 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM244 correlate with, and may be deduced
from, the identity of the target genes which VGAM244
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[7342] Methyl CpG Binding Protein 2 (Rett syndrome) (MECP2,
Accession NM_004992) is a VGAM244 host target gene.

MECP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MECP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MECP2 BINDING SITE, designated SEQ ID:1167, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7343] A function of VGAM244 is therefore inhibition of Methyl CpG Binding Protein 2 (Rett syndrome) (MECP2, Accession NM_004992). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MECP2. ATPase, Class V, Type 10B (ATP10B, Accession XM_032721) is another VGAM244 host target gene. ATP10B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP10B BINDING SITE, designated SEQ ID:2655, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also

designated SEQ ID:579.

[7344] Another function of VGAM244 is therefore inhibition of ATPase, Class V, Type 10B (ATP10B, Accession XM_032721). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP10B. BDG-29 (Accession XM_051343) is another VGAM244 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:2943, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7345] Another function of VGAM244 is therefore inhibition of BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. GW112 (Accession NM_006418) is another VGAM244 host target gene. GW112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by GW112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GW112 BINDING SITE, designated SEQ ID:1298, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7346] Another function of VGAM244 is therefore inhibition of GW112 (Accession NM_006418). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GW112.

Heat Shock 27kDa Protein Family, Member 7

(cardiovascular) (HSPB7, Accession NM_014424) is another VGAM244 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:1498, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7347] Another function of VGAM244 is therefore inhibition of

Heat Shock 27kDa Protein Family, Member 7

(cardiovascular) (HSPB7, Accession NM_014424). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. KIAA1464 (Accession XM_043069) is another VGAM244 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:2813, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7348] Another function of VGAM244 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1634 (Accession XM_032749) is another VGAM244 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:2656, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7349] Another function of VGAM244 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138999) is another VGAM244 host target gene. NETO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NETO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NETO1 BINDING SITE, designated SEQ ID:2463, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7350] Another function of VGAM244 is therefore inhibition of Neuropilin (NRP) and Tolloid (TLL)-like 1 (NETO1, Accession NM_138999). Accordingly, utilities of VGAM244 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with NETO1. PRO2533 (Accession NM_018629) is another VGAM244 host target gene. PRO2533 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRO2533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2533 BINDING SITE, designated SEQ ID:1854, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7351] Another function of VGAM244 is therefore inhibition of PRO2533 (Accession NM_018629). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2533. LOC151201 (Accession XM_098021) is another VGAM244 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING

SITE, designated SEQ ID:3343, to the nucleotide sequence of VGAM244 RNA, herein designated VGAM RNA, also designated SEQ ID:579.

[7352] Another function of VGAM244 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM244 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 245 (VGAM245) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7353] VGAM245 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM245 was detected is described hereinabove with reference to Figs. 1–8.

[7354] VGAM245 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7355] VGAM245 gene encodes a VGAM245 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM245 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM245 precursor RNA is designated SEQ ID:231, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:231 is located at position 133924 relative to the genome of Vaccinia Virus.

[7356] VGAM245 precursor RNA folds onto itself, forming VGAM245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7357] An enzyme complex designated DICER COMPLEX, `dices` the VGAM245 folded precursor RNA into VGAM245 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM245 RNA is designated SEQ ID:580, and is provided hereinbelow with reference to the sequence listing part.

[7358] VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM245 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7359] VGAM245 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM245 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM245 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7360] The complementary binding of VGAM245 RNA, herein designated VGAM RNA, to host target binding sites on VGAM245 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM245 host target RNA into VGAM245 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7361] It is appreciated that VGAM245 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM245 host target genes. The mRNA of each one of this plurality of VGAM245 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM245 RNA, herein designated VGAM RNA, and which when bound by VGAM245 RNA causes inhibition of translation of respective one or more VGAM245 host target proteins.

[7362] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM245 gene, herein designated VGAM GENE, on one or more VGAM245 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[7363] It is yet further appreciated that a function of VGAM245 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM245 correlate with, and may be deduced from, the identity of the host target genes which VGAM245 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7364] Nucleotide sequences of the VGAM245 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM245 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM245 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM245 are further described hereinbelow with reference to Table 1.

[7365] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM245 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM245 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7366] As mentioned hereinabove with reference to Fig. 1, a function of VGAM245 gene, herein designated VGAM is inhibition of expression of VGAM245 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM245 correlate with, and may be deduced from, the identity of the target genes which VGAM245 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7367] FLJ14124 (Accession NM_024868) is a VGAM245 host target gene. FLJ14124 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14124, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14124 BINDING SITE, designated SEQ ID:2099, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7368] A function of VGAM245 is therefore inhibition of FLJ14124

(Accession NM_024868). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14124. FLJ20039 (Accession NM_017635) is another VGAM245 host target gene. FLJ20039 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20039 BINDING SITE, designated SEQ ID:1735, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7369] Another function of VGAM245 is therefore inhibition of FLJ20039 (Accession NM_017635). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20039. FLJ21369 (Accession NM_024802) is another VGAM245 host target gene. FLJ21369 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ21369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ21369 BINDING SITE, designated SEQ ID:2090, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7370] Another function of VGAM245 is therefore inhibition of FLJ21369 (Accession NM_024802). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21369. KIAA1577 (Accession XM_035299) is another VGAM245 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:2690, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7371] Another function of VGAM245 is therefore inhibition of KIAA1577 (Accession XM_035299). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577. LOC144524 (Accession XM_096624) is another

VGAM245 host target gene. LOC144524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144524 BINDING SITE, designated SEQ ID:3269, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7372] Another function of VGAM245 is therefore inhibition of LOC144524 (Accession XM_096624). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144524. LOC150170 (Accession XM_086799) is another VGAM245 host target gene. LOC150170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150170 BINDING SITE, designated SEQ ID:3143, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7373] Another function of VGAM245 is therefore inhibition of LOC150170 (Accession XM_086799). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150170. LOC150175 (Accession XM_086806) is another VGAM245 host target gene. LOC150175 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150175 BINDING SITE, designated SEQ ID:3144, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7374] Another function of VGAM245 is therefore inhibition of LOC150175 (Accession XM_086806). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150175. LOC150215 (Accession XM_086813) is another VGAM245 host target gene. LOC150215 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150215, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150215 BINDING SITE, designated SEQ ID:3145, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7375] Another function of VGAM245 is therefore inhibition of LOC150215 (Accession XM_086813). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150215. LOC150218 (Accession XM_086850) is another VGAM245 host target gene. LOC150218 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150218, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150218 BINDING SITE, designated SEQ ID:3146, to the nucleotide sequence of VGAM245 RNA, herein designated VGAM RNA, also designated SEQ ID:580.

[7376] Another function of VGAM245 is therefore inhibition of LOC150218 (Accession XM_086850). Accordingly, utilities of VGAM245 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC150218. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 246 (VGAM246) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7377] VGAM246 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM246 was detected is described hereinabove with reference to Figs. 1–8.

[7378] VGAM246 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7379] VGAM246 gene encodes a VGAM246 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM246 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM246 precursor RNA is designated SEQ ID:232, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:232 is located at position 136295 relative to the genome of Vaccinia Virus.

[7380] VGAM246 precursor RNA folds onto itself, forming VGAM246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7381] An enzyme complex designated DICER COMPLEX, `dices` the VGAM246 folded precursor RNA into VGAM246 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM246 RNA is designated SEQ ID:581, and is provided hereinbelow with reference to the sequence listing part.

[7382] VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM246 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7383] VGAM246 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM246 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM246 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7384] The complementary binding of VGAM246 RNA, herein designated VGAM RNA, to host target binding sites on VGAM246 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM246 host target RNA into VGAM246 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7385] It is appreciated that VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM246 host target genes. The mRNA of each one of this plurality of VGAM246 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM246 RNA, herein designated VGAM RNA, and which when bound by VGAM246 RNA causes in-

hibition of translation of respective one or more VGAM246 host target proteins.

[7386] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM246 gene, herein designated VGAM GENE, on one or more VGAM246 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7387] It is yet further appreciated that a function of VGAM246 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM246 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM246 correlate with, and may be deduced from, the identity of the host target genes which VGAM246 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [7388] Nucleotide sequences of the VGAM246 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM246 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM246 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM246 are further described hereinbelow with reference to Table 1.
- [7389] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM246 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM246 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [7390] As mentioned hereinabove with reference to Fig. 1, a function of VGAM246 gene, herein designated VGAM is inhibition of expression of VGAM246 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM246 correlate with, and may be deduced from, the identity of the target genes which VGAM246 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7391] Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM_016557) is a VGAM246 host target gene. CCRL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCRL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCRL1 BINDING SITE, designated SEQ ID:1697, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7392] A function of VGAM246 is therefore inhibition of Chemokine (C-C motif) Receptor-like 1 (CCRL1, Accession NM_016557), a gene which is a G protein-coupled receptor that binds chemokines of the CC subfamily, especially MCP-4, ELC (SCYA19) and TECK (SCYA25). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCRL1. The function of CCRL1 has been established

by previous studies. Chemokine receptors are members of the 7-transmembrane-spanning, G protein-coupled receptor family that recognize small proteins responsible for the directed migration of specific cell types. Depending on the number of amino acids between the first 2 cysteines of their ligands (they may have more than 1 ligand), chemokine receptors are designated CCR (adjacent cysteines), CXCR (1 amino acid between the cysteines), or CX3CR (3 amino acids between the cysteines). The 'R' designation refers to proteins that not only bind, but also have a signaling function after binding. By searching an EST database for PPR1 homologs, Schweickart et al. (2000) obtained a cDNA encoding CCRL1, which they called CCR11. They initially reported that CCRL1 shares functional similarity to CCR2 (OMIM Ref. No. 601267) because it has a chemotactic response to MCP family chemokines (e.g., MCP2; 602283). However, in an erratum, Schweickart et al. (2000) corrected their functional data and stated that cells expressing CCRL1 do not have a chemotactic response to MCP family chemokines. They confirmed that CCRL1 binds ELC, SLC, and TECK, as reported by Gosling et al. (2000).

[7393] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [7394] Schweickart, V. L.; Epp, A.; Raport, C. J.; Gray, P. W. : CCR11 is a functional receptor for the monocyte chemoattractant protein family of chemokines. J. Biol. Chem. 275: 9550–9556, 2000. Note: Erratum: J. Biol. Chem. 276: 856 only, 2001. ; and
- [7395] Gosling, J.; Dairaghi, D. J.; Wang, Y.; Hanley, M.; Talbot, D.; Miao, Z.; Schall, T. J. : Cutting edge: identification of a novel chemokine receptor that binds dendritic cell- and T cel.
- [7396] Further studies establishing the function and utilities of CCRL1 are found in John Hopkins OMIM database record ID 606065, and in cited publications numbered 1599–1476 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM246 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:741, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7397] Another function of VGAM246 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM_002800) is another VGAM246 host target gene. PSMB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSMB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMB9 BINDING SITE, designated SEQ ID:956, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7398] Another function of VGAM246 is therefore inhibition of

Proteasome (prosome, macropain) Subunit, Beta Type, 9 (large multifunctional protease 2) (PSMB9, Accession NM_002800), a gene which is one component of a multicatalytic proteinase complex. Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSMB9. The function of PSMB9 has been established by previous studies. Driscoll et al. (1993) showed that the MHC-linked LMP2 and LMP7 subunits function to amplify specific endopeptidase activities of the proteasome. Gaczynska et al. (1993) presented experiments suggesting that gamma-interferon and expression of the LMP2 and LMP7 genes should favor the production by proteasomes of the types of peptides found on MHC class I molecules, which terminate almost exclusively with hydrophobic or basic residues. Animal model experiments lend further support to the function of PSMB9. Van Kaer et al. (1994) generated healthy mice with disrupted *Lmp2* genes. Proteasomal peptidase activity against hydrophobic and basic substrates but not acidic substrates was lower in spleen and liver from mutant mice compared with wildtype mice. Differences in muscle and brain were not significant. Although flow cytometric analysis showed no difference in

MHC class I expression, antigen-presenting cells from mutant mice were less able to stimulate a T-cell hybridoma specific for a nucleoprotein (NP) envelope antigen of an influenza A virus. Mutant mice also had less than half of the wildtype levels of CD8 (see OMIM Ref. No. 186910)-positive T lymphocytes and generated much lower levels of cytotoxic T-cell precursors specific for NP, though not for ovalbumin. Van Kaer et al. (1994) concluded that LMP2 selectively influences antigen processing of MHC class I-restricted antigens.

[7399] It is appreciated that the abovementioned animal model for PSMB9 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7401] Van Kaer, L.; Ashton-Rickardt, P. G.; Eichelberger, M.; Gaczynska, M.; Nagashima, K.; Rock, K. L.; Goldberg, A. L.; Doherty, P. C.; Tonegawa, S. : Altered peptidase and viral-specific T cell response in LMP2 mutant mice. *Immunity* 1: 533-541, 1994. ; and

[7402] Driscoll, J.; Brown, M. G.; Finley, D.; Monaco, J. J. : MHC-

linked LMP gene products specifically alter peptidase activities of the proteasome. Nature 365: 262–264, 1993.

[7403] Further studies establishing the function and utilities of PSMB9 are found in John Hopkins OMIM database record ID 177045, and in cited publications numbered 285–288, 94 and 2182–2186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759) is another VGAM246 host target gene. SLC4A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A4 BINDING SITE, designated SEQ ID:1055, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7404] Another function of VGAM246 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 4 (SLC4A4, Accession NM_003759), a gene which is a sodium bicarbonate cotransporter. Accordingly, utilities of VGAM246 include diagnosis, preven-

tion and treatment of diseases and clinical conditions associated with SLC4A4. The function of SLC4A4 and its association with various diseases and clinical conditions, has been established by previous studies, as described herein above with reference to VGAM49. Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM_021137) is another VGAM246 host target gene. TNFAIP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFAIP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFAIP1 BINDING SITE, designated SEQ ID:1944, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7405] Another function of VGAM246 is therefore inhibition of Tumor Necrosis Factor, Alpha-induced Protein 1 (endothelial) (TNFAIP1, Accession NM_021137). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFAIP1. CAT56 (Accession NM_025263) is another VGAM246 host target gene. CAT56 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAT56, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAT56 BINDING SITE, designated SEQ ID:2149, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7406] Another function of VGAM246 is therefore inhibition of CAT56 (Accession NM_025263). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAT56. FLJ10520 (Accession NM_018124) is another VGAM246 host target gene. FLJ10520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10520 BINDING SITE, designated SEQ ID:1785, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7407] Another function of VGAM246 is therefore inhibition of

FLJ10520 (Accession NM_018124). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10520. FLJ14001 (Accession NM_024677) is another VGAM246 host target gene. FLJ14001 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14001 BINDING SITE, designated SEQ ID:2081, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7408] Another function of VGAM246 is therefore inhibition of FLJ14001 (Accession NM_024677). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14001. FLJ14917 (Accession NM_032861) is another VGAM246 host target gene. FLJ14917 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14917, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ14917 BINDING SITE, designated SEQ ID:2290, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7409] Another function of VGAM246 is therefore inhibition of FLJ14917 (Accession NM_032861). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14917. KIAA0618 (Accession NM_014833) is another VGAM246 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:1564, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7410] Another function of VGAM246 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA1750 (Accession XM_043067) is another

VGAM246 host target gene. KIAA1750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1750 BINDING SITE, designated SEQ ID:2812, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7411] Another function of VGAM246 is therefore inhibition of KIAA1750 (Accession XM_043067). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1750. MAGEF1 (Accession XM_011074) is another VGAM246 host target gene. MAGEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAGEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEF1 BINDING SITE, designated SEQ ID:2555, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7412] Another function of VGAM246 is therefore inhibition of MAGEF1 (Accession XM_011074). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEF1. LOC253017 (Accession XM_171068) is another VGAM246 host target gene. LOC253017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253017 BINDING SITE, designated SEQ ID:3685, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7413] Another function of VGAM246 is therefore inhibition of LOC253017 (Accession XM_171068). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253017. LOC51705 (Accession NM_016242) is another VGAM246 host target gene. LOC51705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51705, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51705 BINDING SITE, designated SEQ ID:1674, to the nucleotide sequence of VGAM246 RNA, herein designated VGAM RNA, also designated SEQ ID:581.

[7414] Another function of VGAM246 is therefore inhibition of LOC51705 (Accession NM_016242). Accordingly, utilities of VGAM246 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51705. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 247 (VGAM247) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7415] VGAM247 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM247 was detected is described hereinabove with reference to Figs. 1–8.

[7416] VGAM247 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM247 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[7417] VGAM247 gene encodes a VGAM247 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM247 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM247 precursor RNA is designated SEQ ID:233, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:233 is located at position 138880 relative to the genome of Vaccinia Virus.

[7418] VGAM247 precursor RNA folds onto itself, forming VGAM247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7419] An enzyme complex designated DICER COMPLEX, `dices` the VGAM247 folded precursor RNA into VGAM247 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM247 RNA is designated SEQ ID:582, and is provided hereinbelow with reference to the sequence listing part.

[7420] VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM247 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7421] VGAM247 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM247 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM247 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7422] The complementary binding of VGAM247 RNA, herein designated VGAM RNA, to host target binding sites on VGAM247 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM247 host target RNA into VGAM247 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[7423] It is appreciated that VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM247 host target genes. The mRNA of each one of this plurality of VGAM247 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM247 RNA, herein designated VGAM RNA, and which when bound by VGAM247 RNA causes inhibition of translation of respective one or more VGAM247 host target proteins.

[7424] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM247 gene, herein designated VGAM GENE, on one or more VGAM247 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7425] It is yet further appreciated that a function of VGAM247 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM247 correlate with, and may be deduced from, the identity of the host target genes which VGAM247 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7426] Nucleotide sequences of the VGAM247 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM247 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM247 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM247 are further described hereinbelow with reference to Table 1.

[7427] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM247 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM247 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7428] As mentioned hereinabove with reference to Fig. 1, a function of VGAM247 gene, herein designated VGAM is inhibition of expression of VGAM247 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM247 correlate with, and may be deduced from, the identity of the target genes which VGAM247 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7429] B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898) is a VGAM247 host target gene. BCL11B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BCL11B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL11B BINDING SITE, designated SEQ ID:2019, to the nucleotide sequence of VGAM247 RNA,

herein designated VGAM RNA, also designated SEQ ID:582.

[7430] A function of VGAM247 is therefore inhibition of B-cell CLL/lymphoma 11B (zinc finger protein) (BCL11B, Accession NM_022898). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL11B. Fibroblast Growth Factor Receptor 4 (FGFR4, Accession NM_022963) is another VGAM247 host target gene. FGFR4 BINDING SITE1 and FGFR4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FGFR4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGFR4 BINDING SITE1 and FGFR4 BINDING SITE2, designated SEQ ID:2022 and SEQ ID:887 respectively, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:582.

[7431] Another function of VGAM247 is therefore inhibition of Fibroblast Growth Factor Receptor 4 (FGFR4, Accession NM_022963), a gene which receptor tyrosine kinase, preferentially binds acidic FGF. Accordingly, utilities of

VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGFR4. The function of FGFR4 has been established by previous studies. Partanen et al. (1991) reported the cDNA cloning and analysis of a novel member of the fibroblast growth factor receptor (FGFR) gene family expressed in K562 erythro leukemia cells. Its deduced amino acid sequence was 55% identical with the previously characterized FGFRs, FLG (FGFR1; 136350) and BEK (OMIM Ref. No. 176943), and had the structural characteristics of an FGFR family member including 3 immunoglobulin-like domains in its extracellular part. The expression pattern of FGFR4 was found to be distinct from that of FLG and BEK and also distinct from that of FGFR3 (OMIM Ref. No. 134934), which they (Keegan et al., 1991) had also cloned from K562 erythro leukemia cells. To elucidate further the physiologic relevance of protein-tyrosine kinases and to search for additional members of the gene family as possible factors in carcinogenesis, Holtrich et al. (1991) amplified mRNA from lung tissue by the polymerase chain reaction (PCR) using PTK-specific primers followed by sequencing of the clones. They identified a novel protein-tyrosine kinase, which they called TKF (tyrosine kinase related to fibroblast

growth factor receptor). Among a wide variety of cells and tissues tested, including human lymphocytes and macrophages, TKF was found to be expressed only in lung and in some tumors of lung origin as well as in malignancies not derived from lung tissues. Sequence comparison has demonstrated that TKF is identical to FGFR4 (Scott, 1999). By analysis of somatic cell hybrids and by in situ hybridization, Armstrong et al. (1992) mapped the FGFR4 gene to 5q33-qter, an area involved in leukemias and lymphomas. In a radiation hybrid mapping of 18 genes on distal 5q, Warrington et al. (1992) found that the FGFR4 gene lies distal to DRD1 with high probability. Assuming that the mapping of DRD1 is correct, FGFR4 would be located in the segment 5q35.1-qter. Using an interspecific backcross mapping panel, Avraham et al. (1994) mapped the Fgfr4 gene to mouse chromosome 13 in a region of homology of synteny with distal human 5q.

[7432] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7433] Holtrich, U.; Brauninger, A.; Strebhardt, K.; Rubsamen-Waigmann, H. : Two additional protein-tyrosine kinases expressed in human lung: fourth member of the fibroblast

growth factor receptor family and an intracellular protein-tyrosine kinase. Proc. Nat. Acad. Sci. 88: 10411–10415, 1991. ; and

[7434] Avraham, K. B.; Givol, D.; Avivi, A.; Yayon, A.; Copeland, N. G.; Jenkins, N. A. : Mapping of murine fibroblast growth factor receptors refines regions of homology between mouse and huma.

[7435] Further studies establishing the function and utilities of FGFR4 are found in John Hopkins OMIM database record ID 134935, and in cited publications numbered 993, 994–995, 273 and 996–1000 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.SSH2 (Accession XM_030846) is another VGAM247 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:2625, to the nucleotide sequence of VGAM247 RNA, herein designated VGAM RNA, also designated SEQ ID:582.

[7436] Another function of VGAM247 is therefore inhibition of

SSH2 (Accession XM_030846). Accordingly, utilities of VGAM247 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 248 (VGAM248) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7437] VGAM248 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM248 was detected is described hereinabove with reference to Figs. 1–8.

[7438] VGAM248 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7439] VGAM248 gene encodes a VGAM248 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM248 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM248 precursor RNA is designated SEQ ID:234, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:234 is located at position 138729 relative to the genome of Vaccinia Virus.

[7440] VGAM248 precursor RNA folds onto itself, forming VGAM248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7441] An enzyme complex designated DICER COMPLEX, `dices` the VGAM248 folded precursor RNA into VGAM248 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM248 RNA is designated SEQ ID:583, and is

provided hereinbelow with reference to the sequence listing part.

[7442] VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM248 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7443] VGAM248 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM248 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM248 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7444] The complementary binding of VGAM248 RNA, herein designated VGAM RNA, to host target binding sites on VGAM248 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM248 host target RNA into VGAM248 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7445] It is appreciated that VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM248 host target genes. The mRNA of each one of this plurality of VGAM248 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM248 RNA, herein designated VGAM RNA, and which when bound by VGAM248 RNA causes inhibition of translation of respective one or more VGAM248 host target proteins.

[7446] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM248 gene, herein designated VGAM GENE, on one or more VGAM248 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7447] It is yet further appreciated that a function of VGAM248 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM248 correlate with, and may be deduced from, the identity of the host target genes which VGAM248 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7448] Nucleotide sequences of the VGAM248 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM248 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM248 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM248 are further described hereinbelow with reference to Table 1.

[7449] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM248 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM248 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7450] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM248 gene, herein designated VGAM is inhibition of expression of VGAM248 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM248 correlate with, and may be deduced from, the identity of the target genes which VGAM248 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7451] Retinoic Acid Receptor, Beta (RARβ, Accession NM_000965) is a VGAM248 host target gene. RARB BINDING SITE1 and RARB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RARB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RARB BINDING SITE1 and RARB BINDING SITE2, designated SEQ ID:792 and SEQ ID:1663 respectively, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:583.

[7452] A function of VGAM248 is therefore inhibition of Retinoic Acid Receptor, Beta (RARβ, Accession NM_000965), a gene which is one member of the steroid/thyroid hormone receptor family of ligand-activated transcription factors. Ac-

cordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RARB. The function of RARB has been established by previous studies. The 3 retinoic acid receptors, alpha (RARA; 180240), beta (RARB), and gamma (RARG; 180190), are members of the nuclear receptor superfamily. Retinoic acid was the first morphogen described in vertebrates. The RARA and RARB genes are more homologous to those of the 2 closely related thyroid hormone receptors THRA and THRB, located on chromosomes 17 and 3, respectively, than to any other members of the nuclear receptor family. These observations suggest that the thyroid hormone and retinoic acid receptors evolved by gene, and possibly chromosome, duplications from a common ancestor which itself diverged rather early in evolution from the common ancestor of the steroid receptor group of the family. The RARB gene, formerly symbolized HAP, maps to 3p24 by somatic cell hybridization and in situ hybridization. Benbrook et al. (1988) showed a predominant distribution in epithelial tissues and therefore used the designation RAR(epsilon). By in situ hybridization, Mattei et al. (1988) assigned the RARB gene to 3p24. Using deletion mapping, de The et al. (1990) identified a 27-bp

fragment located 59-bp upstream of the transcriptional start, which confers retinoic acid responsiveness on the herpesvirus thymidine kinase promoter. They found indications that both alpha and beta receptors act through the same DNA sequence. Mattei et al. (1991) assigned the corresponding gene to chromosome 14, band A, in the mouse, and to chromosome 15 in the rat. Nadeau et al. (1992) confirmed assignment of the mouse homolog to the centromeric portion of chromosome 14. From a comparison of a hepatitis-B virus (HBV) integration site present in a particular human hepatocellular carcinoma (HCC; 114550) with the corresponding unoccupied site in the nontumorous tissue of the same liver, Dejean et al. (1986) found that HBV integration placed the viral sequence next to a liver cell sequence that bears a striking resemblance to both an oncogene, ERBA (OMIM Ref. No. 190120), and the supposed DNA-binding domain of the human glucocorticoid receptor (OMIM Ref. No. 138040) and estrogen receptor (OMIM Ref. No. 133430) genes. Dejean et al. (1986) suggested that this gene, usually silent or transcribed at a very low level in normal hepatocytes, becomes inappropriately expressed as a consequence of HBV integration, thus contributing to the cell transforma-

tion. By means of a panel of rodent–human somatic cell hybrid DNAs, Dejean et al. (1986) localized the gene to chromosome 3. Further studies by de The et al. (1987) suggested that the HAP gene product may be a novel ligand–responsive regulatory protein whose inappropriate expression in liver is related to hepatocellular carcinogenesis. Brand et al. (1988) showed that the novel protein called HAP (for HBV–activated protein) is a retinoic acid receptor. They referred to this receptor as the beta type (RARβ) and mapped it to 3p25–p21.

[7453] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7454] Benbrook, D.; Lernhardt, E.; Pfahl, M. : A new retinoic acid receptor identified from a hepatocellular carcinoma. (Letter) Nature 333: 669–672, 1988. ; and

[7455] de The, H.; Marchio, A.; Tiollais, P.; Dejean, A. : A novel steroid thyroid hormone receptor–related gene inappropriately expressed in human hepatocellular carcinoma. Nature 330: 667–670.

[7456] Further studies establishing the function and utilities of RARβ are found in John Hopkins OMIM database record ID 180220, and in cited publications numbered 1319–1322,

1331-133 and 2548-1336 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 337 (ZNF337, Accession XM_042807) is another VGAM248 host target gene.

ZNF337 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF337 BINDING SITE, designated SEQ ID:2806, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:583.

[7457] Another function of VGAM248 is therefore inhibition of Zinc Finger Protein 337 (ZNF337, Accession XM_042807). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF337. LOC139231 (Accession XM_060020) is another VGAM248 host target gene. LOC139231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139231 BINDING SITE, designated SEQ ID:3021, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:583.

[7458] Another function of VGAM248 is therefore inhibition of LOC139231 (Accession XM_060020). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139231. LOC221399 (Accession XM_168134) is another VGAM248 host target gene. LOC221399 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221399, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221399 BINDING SITE, designated SEQ ID:3622, to the nucleotide sequence of VGAM248 RNA, herein designated VGAM RNA, also designated SEQ ID:583.

[7459] Another function of VGAM248 is therefore inhibition of LOC221399 (Accession XM_168134). Accordingly, utilities of VGAM248 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221399. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 249 (VGAM249) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7460] VGAM249 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM249 was detected is described hereinabove with reference to Figs. 1–8.

[7461] VGAM249 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7462] VGAM249 gene encodes a VGAM249 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM249 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM249 precursor RNA is designated SEQ ID:235, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:235 is located at position 139033 relative to the genome of Vaccinia Virus.

[7463] VGAM249 precursor RNA folds onto itself, forming VGAM249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7464] An enzyme complex designated DICER COMPLEX, `dices` the VGAM249 folded precursor RNA into VGAM249 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM249 RNA is designated SEQ ID:584, and is provided hereinbelow with reference to the sequence listing part.

[7465] VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM249 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7466] VGAM249 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM249 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM249 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7467] The complementary binding of VGAM249 RNA, herein designated VGAM RNA, to host target binding sites on VGAM249 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM249 host target RNA into VGAM249 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7468] It is appreciated that VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM249 host target genes. The mRNA of each one of this plurality of VGAM249 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM249 RNA, herein designated VGAM RNA, and which when bound by VGAM249 RNA causes in-

hibition of translation of respective one or more VGAM249 host target proteins.

[7469] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM249 gene, herein designated VGAM GENE, on one or more VGAM249 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7470] It is yet further appreciated that a function of VGAM249 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM249 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM249 correlate with, and may be deduced from, the identity of the host target genes which VGAM249 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [7471] Nucleotide sequences of the VGAM249 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM249 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM249 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM249 are further described hereinbelow with reference to Table 1.
- [7472] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM249 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM249 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [7473] As mentioned hereinabove with reference to Fig. 1, a function of VGAM249 gene, herein designated VGAM is inhibition of expression of VGAM249 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM249 correlate with, and may be deduced from, the identity of the target genes which VGAM249 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7474] DKFZp762E1511 (Accession XM_003460) is a VGAM249 host target gene. DKFZp762E1511 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp762E1511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp762E1511 BINDING SITE, designated SEQ ID:2530, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:584.

[7475] A function of VGAM249 is therefore inhibition of DKFZp762E1511 (Accession XM_003460). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp762E1511. LOC123591 (Accession XM_063741) is another VGAM249 host target gene. LOC123591 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC123591, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123591 BINDING SITE, designated SEQ ID:3032, to the nucleotide sequence of VGAM249 RNA, herein designated VGAM RNA, also designated SEQ ID:584.

[7476] Another function of VGAM249 is therefore inhibition of LOC123591 (Accession XM_063741). Accordingly, utilities of VGAM249 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123591. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 250 (VGAM250) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7477] VGAM250 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM250 was detected is described hereinabove with reference to Figs. 1–8.

[7478] VGAM250 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7479] VGAM250 gene encodes a VGAM250 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM250 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM250 precursor RNA is designated SEQ ID:236, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:236 is located at position 139228 relative to the genome of Vaccinia Virus.

[7480] VGAM250 precursor RNA folds onto itself, forming VGAM250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7481] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM250 folded precursor RNA into VGAM250 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM250 RNA is designated SEQ ID:585, and is provided hereinbelow with reference to the sequence listing part.

[7482] VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM250 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7483] VGAM250 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM250 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM250 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7484] The complementary binding of VGAM250 RNA, herein designated VGAM RNA, to host target binding sites on VGAM250 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM250 host target RNA into VGAM250 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7485] It is appreciated that VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM250 host target genes. The mRNA of each one of this plurality of VGAM250 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM250 RNA, herein designated VGAM RNA, and which when bound by VGAM250 RNA causes inhibition of translation of respective one or more VGAM250 host target proteins.

[7486] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM250 gene, herein designated VGAM GENE, on one or more VGAM250 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7487] It is yet further appreciated that a function of VGAM250 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM250 correlate with, and may be deduced from, the identity of the host target genes which VGAM250 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7488] Nucleotide sequences of the VGAM250 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM250 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM250 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM250 are further described hereinbelow with reference to Table 1.

[7489] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM250 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM250 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7490] As mentioned hereinabove with reference to Fig. 1, a function of VGAM250 gene, herein designated VGAM is inhibition of expression of VGAM250 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM250 correlate with, and may be deduced from, the identity of the target genes which VGAM250 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7491] Ephrin-B2 (EFNB2, Accession NM_004093) is a VGAM250 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:1085, to the nucleotide sequence of

VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7492] A function of VGAM250 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM_004093). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFNB2. Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_022977) is another VGAM250 host target gene. FACL4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FACL4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FACL4 BINDING SITE, designated SEQ ID:2025, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7493] Another function of VGAM250 is therefore inhibition of Fatty-acid-Coenzyme A Ligase, Long-chain 4 (FACL4, Accession NM_022977). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FACL4. GATA Binding Protein 2 (GATA2, Accession NM_002050) is another

VGAM250 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GATA2 BINDING SITE, designated SEQ ID:892, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7494] Another function of VGAM250 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. Insulin Receptor Substrate 2 (IRS2, Accession XM_007095) is another VGAM250 host target gene. IRS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRS2 BINDING SITE, designated SEQ ID:2540, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7495] Another function of VGAM250 is therefore inhibition of Insulin Receptor Substrate 2 (IRS2, Accession XM_007095), a gene which may mediate the control of various cellular processes by insulin. Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRS2. The function of IRS2 has been established by previous studies. The protein IRS1 (OMIM Ref. No. 147545) acts as an interface between signaling proteins with Src homology-2 domains (SH2 proteins) and the receptors for insulin (INS; 176730), IGF2 (OMIM Ref. No. 147470), growth hormone (GH1; 139250), several interleukins (IL4, 147780; IL9, 146931; IL13, 147683), and other cytokines. It regulates gene expression and stimulates mitogenesis and appears to mediate insulin/IGF1-stimulated glucose transport. Thus, the finding that survival of the homozygous *Irs1* knockout mouse with only mild resistance to hypertension was surprising. This dilemma was provisionally resolved by the discovery by Sun et al. (1995) of a second IRS signaling protein in mouse. They purified and cloned a likely candidate from mouse myeloid progenitor cells and, because of its resemblance to IRS1, they designated it IRS2. Alignment of the sequences of IRS2 and IRS1

demonstrated a highly conserved N terminus containing a pleckstrin-homology domain and a phosphotyrosine-binding (PTB) domain, and a poorly conserved C terminus containing several tyrosine phosphorylation motifs. IRS2 is expressed in many cells, including tissues from the homozygous IRS1 knockout mouse. Sun et al. (1995) suggested that IRS2 may be essential for signaling by several receptor systems. Mammarella et al. (2000) genotyped 193 Italian patients with type II diabetes (OMIM Ref. No. 125853) and 206 control subjects for the IRS2 G1057D polymorphism (600797.0001). They found evidence for a strong association between type II diabetes and the polymorphism, which appears to be protective against type II diabetes in a codominant fashion. Animal model experiments lend further support to the function of IRS2. Tobe et al. (2001) observed that *Irs2*-deficient mice (Kubota et al. (2000)) showed increased adiposity with increased serum leptin level, suggesting leptin resistance before the mice developed diabetes. Using oligonucleotide microarray and Northern blot analyses to analyze gene expression, Tobe et al. (2001) detected increased expression of SREBP1, a downstream target of insulin, in *Irs2*-deficient mouse liver. Using high dose leptin administration, They

provided evidence that leptin resistance in Irs2-deficient mice is causally related to SREBP1 gene induction. The authors concluded that Irs2 gene disruption results in leptin resistance, causing SREBP1 gene induction, obesity, fatty liver, and diabetes

[7496] It is appreciated that the abovementioned animal model for IRS2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7497] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7498] Sun, X. J.; Wang, L.-M.; Zhang, Y.; Yenush, L.; Myers, M. G., Jr.; Glasheen, E.; Lane, W. S.; Pierce, J. H.; White, M. F. : Role of IRS-2 in insulin and cytokine signalling. Nature 377: 173-177, 1995. ; and

[7499] Tobe, K.; Suzuki, R.; Aoyama, M.; Yamauchi, T.; Kamon, J.; Kubota, N.; Terauchi, Y.; Matsui, J.; Akanuma, Y.; Kimura, S.; Tanaka, J.; Abe, M.; Ohsumi, J.; Nagai, R.; Kadowaki, T. : Incre.

[7500] Further studies establishing the function and utilities of IRS2 are found in John Hopkins OMIM database record ID 600797, and in cited publications numbered 17,

351–353, 2864, 249 and 3050–356 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phenylalanine Hydroxylase (PAH, Accession NM_000277) is another VGAM250 host target gene. PAH BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PAH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAH BINDING SITE, designated SEQ ID:725, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7501] Another function of VGAM250 is therefore inhibition of Phenylalanine Hydroxylase (PAH, Accession NM_000277). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAH. Podocalyxin-like (PODXL, Accession NM_005397) is another VGAM250 host target gene. PODXL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PODXL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PODXL BINDING SITE, designated SEQ ID:1207, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7502] Another function of VGAM250 is therefore inhibition of Podocalyxin-like (PODXL, Accession NM_005397), a gene which is an antiadhesin. Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PODXL. The function of PODXL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165. Ribosomal Protein L15 (RPL15, Accession NM_002948) is another VGAM250 host target gene. RPL15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPL15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL15 BINDING SITE, designated SEQ ID:973, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7503] Another function of VGAM250 is therefore inhibition of

Ribosomal Protein L15 (RPL15, Accession NM_002948).

Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with RPL15. Serine (or cysteine) Proteinase Inhibitor, Clade E (nexin, plasminogen activator inhibitor

type 1), Member 1 (SERPINE1, Accession NM_000602) is

another VGAM250 host target gene. SERPINE1 BINDING

SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by SERPINE1, corre-

sponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of

SERPINE1 BINDING SITE, designated SEQ ID:758, to the nu-

cleotide sequence of VGAM250 RNA, herein designated

VGAM RNA, also designated SEQ ID:585.

[7504] Another function of VGAM250 is therefore inhibition of

Serine (or cysteine) Proteinase Inhibitor, Clade E (nexin, plasminogen activator inhibitor type 1), Member 1

(SERPINE1, Accession NM_000602). Accordingly, utilities

of VGAM250 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with SER-

PINE1. ABIN-2 (Accession NM_024309) is another

VGAM250 host target gene. ABIN-2 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by ABIN-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABIN-2 BINDING SITE, designated SEQ ID:2057, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7505] Another function of VGAM250 is therefore inhibition of ABIN-2 (Accession NM_024309). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABIN-2. C20orf48 (Accession NM_024960) is another VGAM250 host target gene. C20orf48 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C20orf48, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf48 BINDING SITE, designated SEQ ID:2118, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7506] Another function of VGAM250 is therefore inhibition of

C20orf48 (Accession NM_024960). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf48. Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586) is another VGAM250 host target gene. C9orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf7 BINDING SITE, designated SEQ ID:1724, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7507] Another function of VGAM250 is therefore inhibition of Chromosome 9 Open Reading Frame 7 (C9orf7, Accession NM_017586). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf7. Dual Specificity Phosphatase 10 (DUSP10, Accession NM_007207) is another VGAM250 host target gene. DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by

DUSP10, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP10 BINDING SITE1 and DUSP10 BINDING SITE2, designated SEQ ID:1364 and SEQ ID:2501 respectively, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7508] Another function of VGAM250 is therefore inhibition of Dual Specificity Phosphatase 10 (DUSP10, Accession NM_007207). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DUSP10. FLJ12892 (Accession XM_042173) is another VGAM250 host target gene. FLJ12892 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12892, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12892 BINDING SITE, designated SEQ ID:2802, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7509] Another function of VGAM250 is therefore inhibition of FLJ12892 (Accession XM_042173). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12892. FLJ22059 (Accession NM_022752) is another VGAM250 host target gene. FLJ22059 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22059, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22059 BINDING SITE, designated SEQ ID:2003, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7510] Another function of VGAM250 is therefore inhibition of FLJ22059 (Accession NM_022752). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22059. HEMK (Accession NM_016173) is another VGAM250 host target gene. HEMK BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HEMK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of HEMK BINDING SITE, designated SEQ ID:1669, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7511] Another function of VGAM250 is therefore inhibition of HEMK (Accession NM_016173). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEMK. KIAA0227 (Accession XM_027236) is another VGAM250 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:2578, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7512] Another function of VGAM250 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0227. KIAA0527 (Accession XM_171054) is another VGAM250 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:3684, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7513] Another function of VGAM250 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA1244 (Accession XM_050424) is another VGAM250 host target gene. KIAA1244 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1244, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1244 BINDING SITE, designated SEQ ID:2930, to the nucleotide sequence of VGAM250 RNA, herein designated

VGAM RNA, also designated SEQ ID:585.

[7514] Another function of VGAM250 is therefore inhibition of KIAA1244 (Accession XM_050424). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1244. KIAA1649 (Accession XM_040095) is another VGAM250 host target gene. KIAA1649 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1649, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1649 BINDING SITE, designated SEQ ID:2771, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7515] Another function of VGAM250 is therefore inhibition of KIAA1649 (Accession XM_040095). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1649. KIAA1981 (Accession XM_114000) is another VGAM250 host target gene. KIAA1981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1981, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE, designated SEQ ID:3431, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7516] Another function of VGAM250 is therefore inhibition of KIAA1981 (Accession XM_114000). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1981. MGC2306 (Accession NM_032638) is another VGAM250 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:2266, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7517] Another function of VGAM250 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC2306. Ribosomal Protein L39-like (RPL39L, Accession NM_052969) is another VGAM250 host target gene. RPL39L BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RPL39L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPL39L BINDING SITE, designated SEQ ID:2352, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7518] Another function of VGAM250 is therefore inhibition of Ribosomal Protein L39-like (RPL39L, Accession NM_052969). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPL39L. Syntaphilin (SNPH, Accession NM_014723) is another VGAM250 host target gene. SNPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of SNPH BINDING SITE, designated SEQ ID:1531, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7519] Another function of VGAM250 is therefore inhibition of Syntaphilin (SNPH, Accession NM_014723). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNPH. TMG3 (Accession NM_024082) is another VGAM250 host target gene. TMG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TMG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TMG3 BINDING SITE, designated SEQ ID:2053, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7520] Another function of VGAM250 is therefore inhibition of TMG3 (Accession NM_024082). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TMG3. LOC145240 (Accession XM_085068) is another VGAM250 host target gene. LOC145240 BINDING SITE is HOST TAR-

GET binding site found in the 3' untranslated region of mRNA encoded by LOC145240, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145240 BINDING SITE, designated SEQ ID:3076, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7521] Another function of VGAM250 is therefore inhibition of LOC145240 (Accession XM_085068). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145240. LOC146287 (Accession XM_096967) is another VGAM250 host target gene. LOC146287 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146287 BINDING SITE, designated SEQ ID:3284, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7522] Another function of VGAM250 is therefore inhibition of

LOC146287 (Accession XM_096967). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146287. LOC148696 (Accession XM_097505) is another VGAM250 host target gene. LOC148696 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148696, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148696 BINDING SITE, designated SEQ ID:3301, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7523] Another function of VGAM250 is therefore inhibition of LOC148696 (Accession XM_097505). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148696. LOC150577 (Accession XM_097918) is another VGAM250 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:3330, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7524] Another function of VGAM250 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC151521 (Accession XM_098076) is another VGAM250 host target gene. LOC151521 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151521, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151521 BINDING SITE, designated SEQ ID:3347, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7525] Another function of VGAM250 is therefore inhibition of LOC151521 (Accession XM_098076). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151521. LOC157273 (Accession XM_098743) is an-

other VGAM250 host target gene. LOC157273 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157273, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157273 BINDING SITE, designated SEQ ID:3379, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7526] Another function of VGAM250 is therefore inhibition of LOC157273 (Accession XM_098743). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157273. LOC163682 (Accession XM_099402) is another VGAM250 host target gene. LOC163682 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163682, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163682 BINDING SITE, designated SEQ ID:3398, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7527] Another function of VGAM250 is therefore inhibition of LOC163682 (Accession XM_099402). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163682. LOC221749 (Accession XM_166341) is another VGAM250 host target gene. LOC221749 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221749, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221749 BINDING SITE, designated SEQ ID:3549, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7528] Another function of VGAM250 is therefore inhibition of LOC221749 (Accession XM_166341). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221749. LOC222234 (Accession XM_168558) is another VGAM250 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222234, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:3646, to the nucleotide sequence of VGAM250 RNA, herein designated VGAM RNA, also designated SEQ ID:585.

[7529] Another function of VGAM250 is therefore inhibition of LOC222234 (Accession XM_168558). Accordingly, utilities of VGAM250 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 251 (VGAM251) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7530] VGAM251 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM251 was detected is described hereinabove with reference to Figs. 1–8.

[7531] VGAM251 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM251 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[7532] VGAM251 gene encodes a VGAM251 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM251 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM251 precursor RNA is designated SEQ ID:237, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:237 is located at position 137709 relative to the genome of Vaccinia Virus.

[7533] VGAM251 precursor RNA folds onto itself, forming VGAM251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7534] An enzyme complex designated DICER COMPLEX, `dices` the VGAM251 folded precursor RNA into VGAM251 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM251 RNA is designated SEQ ID:586, and is provided hereinbelow with reference to the sequence listing part.

[7535] VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM251 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7536] VGAM251 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM251 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM251 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7537] The complementary binding of VGAM251 RNA, herein designated VGAM RNA, to host target binding sites on VGAM251 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM251 host target RNA into VGAM251 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[7538] It is appreciated that VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM251 host target genes. The mRNA of each one of this plurality of VGAM251 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM251 RNA, herein designated VGAM RNA, and which when bound by VGAM251 RNA causes inhibition of translation of respective one or more VGAM251 host target proteins.

[7539] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM251 gene, herein designated VGAM GENE, on one or more VGAM251 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7540] It is yet further appreciated that a function of VGAM251 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM251 correlate with, and may be deduced from, the identity of the host target genes which VGAM251 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7541] Nucleotide sequences of the VGAM251 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM251 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM251 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM251 are further described hereinbelow with reference to Table 1.

[7542] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM251 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM251 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7543] As mentioned hereinabove with reference to Fig. 1, a function of VGAM251 gene, herein designated VGAM is inhibition of expression of VGAM251 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM251 correlate with, and may be deduced from, the identity of the target genes which VGAM251 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7544] ADAMTS-like 1 (ADAMTSL1, Accession NM_139264) is a VGAM251 host target gene. ADAMTSL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTSL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTSL1 BINDING SITE, designated SEQ ID:2479, to the nucleotide sequence of VGAM251 RNA, herein designated

VGAM RNA, also designated SEQ ID:586.

[7545] A function of VGAM251 is therefore inhibition of ADAMTS-like 1 (ADAMTSL1, Accession NM_139264). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTSL1. KIAA1862 (Accession XM_044212) is another VGAM251 host target gene. KIAA1862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1862 BINDING SITE, designated SEQ ID:2834, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:586.

[7546] Another function of VGAM251 is therefore inhibition of KIAA1862 (Accession XM_044212). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1862. LOC153951 (Accession XM_087812) is another VGAM251 host target gene. LOC153951 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC153951, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153951 BINDING SITE, designated SEQ ID:3184, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:586.

[7547] Another function of VGAM251 is therefore inhibition of LOC153951 (Accession XM_087812). Accordingly, utilities of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153951. LOC221596 (Accession XM_166331) is another VGAM251 host target gene. LOC221596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221596 BINDING SITE, designated SEQ ID:3548, to the nucleotide sequence of VGAM251 RNA, herein designated VGAM RNA, also designated SEQ ID:586.

[7548] Another function of VGAM251 is therefore inhibition of LOC221596 (Accession XM_166331). Accordingly, utilities

of VGAM251 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221596. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 252 (VGAM252) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7549] VGAM252 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM252 was detected is described hereinabove with reference to Figs. 1–8.

[7550] VGAM252 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7551] VGAM252 gene encodes a VGAM252 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM252 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM252 precursor RNA is designated SEQ ID:238, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:238 is located at position 140854 relative to the genome of Vaccinia Virus.

[7552] VGAM252 precursor RNA folds onto itself, forming VGAM252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7553] An enzyme complex designated DICER COMPLEX, `dices` the VGAM252 folded precursor RNA into VGAM252 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM252 RNA is designated SEQ ID:587, and is

provided hereinbelow with reference to the sequence listing part.

[7554] VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM252 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7555] VGAM252 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM252 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM252 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7556] The complementary binding of VGAM252 RNA, herein designated VGAM RNA, to host target binding sites on VGAM252 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM252 host target RNA into VGAM252 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7557] It is appreciated that VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM252 host target genes. The mRNA of each one of this plurality of VGAM252 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM252 RNA, herein designated VGAM RNA, and which when bound by VGAM252 RNA causes inhibition of translation of respective one or more VGAM252 host target proteins.

[7558] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM252 gene, herein designated VGAM GENE, on one or more VGAM252 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7559] It is yet further appreciated that a function of VGAM252 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM252 correlate with, and may be deduced from, the identity of the host target genes which VGAM252 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7560] Nucleotide sequences of the VGAM252 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM252 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM252 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM252 are further described hereinbelow with reference to Table 1.

[7561] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM252 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM252 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7562] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM252 gene, herein designated VGAM is inhibition of expression of VGAM252 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM252 correlate with, and may be deduced from, the identity of the target genes which VGAM252 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7563] ESAM (Accession NM_138961) is a VGAM252 host target gene. ESAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ESAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESAM BINDING SITE, designated SEQ ID:2461, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:587.

[7564] A function of VGAM252 is therefore inhibition of ESAM (Accession NM_138961). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESAM. KIAA0379 (Accession XM_042860) is another VGAM252 host target gene. KIAA0379 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by KIAA0379, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0379 BINDING SITE, designated SEQ ID:2809, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:587.

[7565] Another function of VGAM252 is therefore inhibition of KIAA0379 (Accession XM_042860). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0379. LOC161784 (Accession XM_091123) is another VGAM252 host target gene. LOC161784 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC161784, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC161784 BINDING SITE, designated SEQ ID:3241, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:587.

[7566] Another function of VGAM252 is therefore inhibition of LOC161784 (Accession XM_091123). Accordingly, utilities

of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC161784. LOC255229 (Accession XM_170928) is another VGAM252 host target gene. LOC255229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255229 BINDING SITE, designated SEQ ID:3676, to the nucleotide sequence of VGAM252 RNA, herein designated VGAM RNA, also designated SEQ ID:587.

[7567] Another function of VGAM252 is therefore inhibition of LOC255229 (Accession XM_170928). Accordingly, utilities of VGAM252 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255229. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 253 (VGAM253) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7568] VGAM253 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM253 was detected is described hereinabove with reference to Figs. 1–8.

[7569] VGAM253 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7570] VGAM253 gene encodes a VGAM253 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM253 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM253 precursor RNA is designated SEQ ID:239, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:239 is located at position 140990 relative to the genome of Vaccinia Virus.

[7571] VGAM253 precursor RNA folds onto itself, forming VGAM253 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7572] An enzyme complex designated DICER COMPLEX, `dices` the VGAM253 folded precursor RNA into VGAM253 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM253 RNA is designated SEQ ID:588, and is provided hereinbelow with reference to the sequence listing part.

[7573] VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM253 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[7574] VGAM253 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM253 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM253 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7575] The complementary binding of VGAM253 RNA, herein designated VGAM RNA, to host target binding sites on VGAM253 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM253 host target RNA into VGAM253 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7576] It is appreciated that VGAM253 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM253 host target genes. The mRNA of each one of this plurality of VGAM253 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM253 RNA, herein designated VGAM RNA, and which when bound by VGAM253 RNA causes inhibition of translation of respective one or more VGAM253 host target proteins.

[7577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM253 gene, herein designated VGAM GENE, on one or more VGAM253 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7578] It is yet further appreciated that a function of VGAM253 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM253 correlate with, and may be deduced from, the identity of the host target genes which VGAM253 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7579] Nucleotide sequences of the VGAM253 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM253 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM253 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM253 are further
described hereinbelow with reference to Table 1.

[7580] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM253 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM253 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[7581] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM253 gene, herein designated VGAM is
inhibition of expression of VGAM253 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM253 correlate with, and may be deduced
from, the identity of the target genes which VGAM253
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[7582] Huntingtin Interacting Protein 2 (HIP2, Accession
NM_005339) is a VGAM253 host target gene. HIP2 BIND-

ING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIP2 BINDING SITE, designated SEQ ID:1201, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7583] A function of VGAM253 is therefore inhibition of Huntingtin Interacting Protein 2 (HIP2, Accession NM_005339). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIP2. IL2-inducible T-cell Kinase (ITK, Accession NM_005546) is another VGAM253 host target gene. ITK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITK BINDING SITE, designated SEQ ID:1224, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7584] Another function of VGAM253 is therefore inhibition of

IL2-inducible T-cell Kinase (ITK, Accession NM_005546), a gene which plays a role in t cell proliferation and differentiation. Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITK. The function of ITK and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM191. One Cut Domain, Family Member 1 (ONECUT1, Accession XM_030712) is another VGAM253 host target gene. ONECUT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ONECUT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ONECUT1 BINDING SITE, designated SEQ ID:2622, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7585] Another function of VGAM253 is therefore inhibition of One Cut Domain, Family Member 1 (ONECUT1, Accession XM_030712), a gene which is very strongly similar to murine Hnf6 and may regulate transcription of liver-specific genes. Accordingly, utilities of VGAM253 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with ONECUT1. The function of ONECUT1 has been established by previous studies.

Lemaigre et al. (1996) isolated from rat liver a transcription factor, which they called hepatocyte nuclear factor-6, that contains 2 different DNA-binding domains: a novel type of homeodomain, and a homolog of the *Drosophila* cut domain. A similar bipartite sequence had been found only in the genome of *Caenorhabditis elegans*. The HNF6 cDNA encodes a protein of 465 amino acids. By RNase protection assay, the expression of HNF6 was found to be highest in liver, but was also detectable in brain, spleen, and testis. Animal model experiments lend further support to the function of ONECUT1. During mouse development, Hnf6 is expressed in the epithelial cells that are precursors of the exocrine and endocrine pancreatic cells. Jacquemin et al. (2000) investigated the role of Hnf6 in pancreas differentiation by inactivating its gene in the mouse. In hnf6-null embryos, the exocrine pancreas appeared to be normal but endocrine cell differentiation was impaired. The expression of neurogenin-3 (NGN3; 604882), a transcription factor that is essential for determination of endocrine cell precursors, was almost abol-

ished. Consistent with this, Jacquemin et al. (2000) demonstrated that Hnf6 binds to and stimulates the ngn3 gene promoter. At birth, only a few endocrine cells were found and the islets of Langerhans were missing. Later, the number of endocrine cells increased and islets appeared. However, the architecture of the islets was perturbed, and the beta cells were deficient in glucose transporter-2 (SLC2A2; 138160) expression. Adult hnf6-null mice were diabetic. The authors concluded that Hnf6 controls pancreatic endocrine differentiation at the precursor stage and stated that their data identify Hnf6 as the first positive regulator of the proendocrine gene ngn3 in the pancreas.

[7586] It is appreciated that the abovementioned animal model for ONECUT1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[7587] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7588] Jacquemin, P.; Durviaux, S. M.; Jensen, J.; Godfraind, C.; Gradwohl, G.; Guillemot, F.; Madsen, O. D.; Carmeliet, P.; Dewerchin, M.; Collen, D.; Rousseau, G. G.; Lemaigre, F. P.

: Transcription factor hepatocyte nuclear factor 6 regulates pancreatic endocrine cell differentiation and controls expression of the proendocrine gene ngn3. Molec. Cell. Biol. 20: 4445–4454, 2000. ; and

[7589] Lemaigre, F. P.; Durviaux, S. M.; Truong, O.; Lannoy, V. J.; Hsuan, J. J.; Rousseau, G. G. : Hepatocyte nuclear factor 6, a transcription factor that contains a novel type of homeodom.

[7590] Further studies establishing the function and utilities of ONECUT1 are found in John Hopkins OMIM database record ID 604164, and in cited publications numbered 1807–1812 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Butyrophilin, Subfamily 3, Member A2 (BTN3A2, Accession NM_007047) is another VGAM253 host target gene. BTN3A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BTN3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A2 BINDING SITE, designated SEQ ID:1354, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ

ID:588.

[7591] Another function of VGAM253 is therefore inhibition of Butyrophilin, Subfamily 3, Member A2 (BTN3A2, Accession NM_007047). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A2. Butyrophilin, Subfamily 3, Member A3 (BTN3A3, Accession NM_006994) is another VGAM253 host target gene. BTN3A3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BTN3A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A3 BINDING SITE, designated SEQ ID:1343, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7592] Another function of VGAM253 is therefore inhibition of Butyrophilin, Subfamily 3, Member A3 (BTN3A3, Accession NM_006994). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A3. IDN3 (Accession NM_133433) is another VGAM253 host target gene. IDN3 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by IDN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IDN3 BINDING SITE, designated SEQ ID:2416, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7593] Another function of VGAM253 is therefore inhibition of IDN3 (Accession NM_133433). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IDN3. KIAA1635 (Accession XM_042203) is another VGAM253 host target gene. KIAA1635 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1635 BINDING SITE, designated SEQ ID:2803, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7594] Another function of VGAM253 is therefore inhibition of KIAA1635 (Accession XM_042203). Accordingly, utilities

of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1635. LOC130106 (Accession XM_059399) is another VGAM253 host target gene. LOC130106 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC130106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC130106 BINDING SITE, designated SEQ ID:3008, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7595] Another function of VGAM253 is therefore inhibition of LOC130106 (Accession XM_059399). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC130106. LOC151031 (Accession XM_103784) is another VGAM253 host target gene. LOC151031 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC151031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151031 BINDING SITE, designated SEQ ID:3403, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7596] Another function of VGAM253 is therefore inhibition of LOC151031 (Accession XM_103784). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151031. LOC162545 (Accession XM_102745) is another VGAM253 host target gene. LOC162545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC162545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162545 BINDING SITE, designated SEQ ID:3402, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7597] Another function of VGAM253 is therefore inhibition of LOC162545 (Accession XM_102745). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162545. LOC165666 (Accession XM_093359) is another VGAM253 host target gene. LOC165666 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC165666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165666 BINDING SITE, designated SEQ ID:3257, to the nucleotide sequence of VGAM253 RNA, herein designated VGAM RNA, also designated SEQ ID:588.

[7598] Another function of VGAM253 is therefore inhibition of LOC165666 (Accession XM_093359). Accordingly, utilities of VGAM253 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165666. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 254 (VGAM254) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7599] VGAM254 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM254 was detected is described hereinabove with reference to Figs. 1-8.

[7600] VGAM254 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7601] VGAM254 gene encodes a VGAM254 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM254 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM254 precursor RNA is designated SEQ ID:240, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:240 is located at position 141210 relative to the genome of Vaccinia Virus.

[7602] VGAM254 precursor RNA folds onto itself, forming VGAM254 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[7603] An enzyme complex designated DICER COMPLEX, `dices` the VGAM254 folded precursor RNA into VGAM254 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM254 RNA is designated SEQ ID:589, and is provided hereinbelow with reference to the sequence listing part.

[7604] VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM254 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7605] VGAM254 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM254 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM254 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM254 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7606] The complementary binding of VGAM254 RNA, herein designated VGAM RNA, to host target binding sites on VGAM254 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM254 host target RNA into VGAM254 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7607] It is appreciated that VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM254 host target genes. The mRNA of each one of this plurality of VGAM254 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM254 RNA, herein designated VGAM RNA, and which when bound by VGAM254 RNA causes inhibition of translation of respective one or more VGAM254 host target proteins.

[7608] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM254 gene, herein designated VGAM GENE, on one or more VGAM254 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7609] It is yet further appreciated that a function of VGAM254 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM254 correlate with, and may be deduced from, the identity of the host target genes which VGAM254 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7610] Nucleotide sequences of the VGAM254 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM254 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM254 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM254 are further described hereinbelow with reference to Table 1.

[7611] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM254 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM254 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7612] As mentioned hereinabove with reference to Fig. 1, a function of VGAM254 gene, herein designated VGAM is inhibition of expression of VGAM254 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM254 correlate with, and may be deduced from, the identity of the target genes which VGAM254 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7613] Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804) is a VGAM254 host target gene. MEN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of MEN1 BINDING SITE, designated SEQ ID:3599, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7614] A function of VGAM254 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession XM_167804). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. Steroid-5-alpha-reductase, Alpha Polypeptide 2 (3-oxo-5 alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession XM_002471) is another VGAM254 host target gene. SRD5A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SRD5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRD5A2 BINDING SITE, designated SEQ ID:2525, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7615] Another function of VGAM254 is therefore inhibition of Steroid-5-alpha-reductase, Alpha Polypeptide 2 (3-oxo-5

alpha-steroid delta 4-dehydrogenase alpha 2) (SRD5A2, Accession XM_002471). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRD5A2. DKFZP564O043 (Accession XM_166502) is another VGAM254 host target gene. DKFZP564O043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O043 BINDING SITE, designated SEQ ID:3566, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7616] Another function of VGAM254 is therefore inhibition of DKFZP564O043 (Accession XM_166502). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O043. FLJ22794 (Accession XM_166220) is another VGAM254 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:3533, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7617] Another function of VGAM254 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. HTMP10 (Accession NM_033207) is another VGAM254 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:2322, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7618] Another function of VGAM254 is therefore inhibition of HTMP10 (Accession NM_033207). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTMP10.

SEC24 Related Gene Family, Member B (*S. cerevisiae*) (SEC24B, Accession NM_006323) is another VGAM254 host target gene. SEC24B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC24B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC24B BINDING SITE, designated SEQ ID:1288, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7619] Another function of VGAM254 is therefore inhibition of SEC24 Related Gene Family, Member B (*S. cerevisiae*) (SEC24B, Accession NM_006323). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEC24B. LOC196812 (Accession XM_116868) is another VGAM254 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING

SITE, designated SEQ ID:3466, to the nucleotide sequence of VGAM254 RNA, herein designated VGAM RNA, also designated SEQ ID:589.

[7620] Another function of VGAM254 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM254 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 255 (VGAM255) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7621] VGAM255 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM255 was detected is described hereinabove with reference to Figs. 1–8.

[7622] VGAM255 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7623] VGAM255 gene encodes a VGAM255 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM255 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM255 precursor RNA is designated SEQ ID:241, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:241 is located at position 141044 relative to the genome of Vaccinia Virus.

[7624] VGAM255 precursor RNA folds onto itself, forming VGAM255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7625] An enzyme complex designated DICER COMPLEX, `dices` the VGAM255 folded precursor RNA into VGAM255 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 92%) nucleotide sequence of VGAM255 RNA is designated SEQ ID:590, and is provided hereinbelow with reference to the sequence listing part.

[7626] VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM255 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7627] VGAM255 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM255 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM255 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7628] The complementary binding of VGAM255 RNA, herein designated VGAM RNA, to host target binding sites on VGAM255 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM255 host target RNA into VGAM255 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7629] It is appreciated that VGAM255 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM255 host target genes. The mRNA of each one of this plurality of VGAM255 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM255 RNA, herein designated VGAM RNA, and which when bound by VGAM255 RNA causes inhibition of translation of respective one or more VGAM255 host target proteins.

[7630] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM255 gene, herein designated VGAM GENE, on one or more VGAM255 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[7631] It is yet further appreciated that a function of VGAM255 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM255 correlate with, and may be deduced from, the identity of the host target genes which VGAM255 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7632] Nucleotide sequences of the VGAM255 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM255 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM255 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM255 are further described hereinbelow with reference to Table 1.

[7633] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM255 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM255 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7634] As mentioned hereinabove with reference to Fig. 1, a function of VGAM255 gene, herein designated VGAM is inhibition of expression of VGAM255 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM255 correlate with, and may be deduced from, the identity of the target genes which VGAM255 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7635] Attractin (ATRN, Accession NM_139321) is a VGAM255 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:2480, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7636] A function of VGAM255 is therefore inhibition of Attractin

(ATRN, Accession NM_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN has been established by previous studies. Attractin is a human serum glycoprotein that is rapidly expressed on activated T cells and released extracellularly after 48 to 72 hours. Duke-Cohan et al. (1998) cloned attractin and found that, as in its natural serum form, it mediates the spreading of monocytes that becomes the focus for the clustering of nonproliferating T lymphocytes. There are 2 mRNA species with hematopoietic tissue-specific expression that code for a 134-kD protein with a putative serine protease catalytic serine, 4 EGF-like motifs, a CUB domain, a C-type lectin domain, and a domain homologous with the ligand-binding region of the common gamma cytokine chain. Except for the last 2 domains, the overall structure shares high homology with a protein of *Caenorhabditis elegans*, suggesting that attractin has evolved new domains and functions in parallel with the development of cell-mediated immunity. When attractin was identified as the product of the murine 'mahogany'

gene with connections to control of pigmentation and energy metabolism, and the 'mahogany' product was identified and shown to be a transmembrane protein, the possibility of a human membrane attractin in addition to the secreted form was raised. Tang et al. (2000) described the complete genomic sequence of attractin, focusing in particular on the exons coding for the 3-prime region, and showed how both human membrane and secreted attractin arise as a result of alternate splicing of the same gene. They found that soluble attractin arises from transcription of 25 sequential exons on 20p13, where the 3-prime terminal exon contains sequence from a long interspersed nuclear element-1 (OMIM Ref. No. LINE-1) retrotransposon insertion that includes a stop codon and a polyadenylation signal. The mRNA isoform for membrane attraction splices over the LINE-1 exon and includes 5 exons encoding transmembrane and cytoplasmic domains with organization and coding potential almost identical to that of the mouse gene. The relative abundance of soluble and transmembrane isoforms measured by RT-PCR is differentially regulated in lymphoid tissues. Because activation of peripheral blood leukocytes with phytohemagglutinin induces strong expression of cell

surface attractin followed by release of soluble attractin, these results suggested to Tang et al. (2000) that LINE-1 insertion, a genomic event unique to mammals, provided an evolutionarily mechanism for regulating cell interactions during an inflammatory reaction.

- [7640] Further studies establishing the function and utilities of ATRN are found in John Hopkins OMIM database record ID 603130, and in cited publications numbered 130–13 and 1186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD59 Antigen

P18–20 (antigen identified by monoclonal antibodies 16.3A5, EJ16, EJ30, EL32 and G344) (CD59, Accession NM_000611) is another VGAM255 host target gene. CD59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD59 BINDING SITE, designated SEQ ID:760, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7641] Another function of VGAM255 is therefore inhibition of CD59 Antigen P18–20 (antigen identified by monoclonal antibodies 16.3A5, EJ16, EJ30, EL32 and G344) (CD59, Accession NM_000611), a gene which restricts lysis of human erythrocytes and leukocytes by homologous complement. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD59. The function of CD59 has been established by previous studies. The CD59 antigen recognized by monoclonal antibody MEM–43 is an 18– to 25–kD glycoprotein expressed on all human peripheral blood leukocytes, erythrocytes, and several human cell

lines. A close relationship to Ly6 of the mouse has been demonstrated. Antigens encoded by both Ly6 and CD59 genes are important to T-cell and NK-cell function. CD59 is also known as protectin. Its function is to restrict lysis of human erythrocytes and leukocytes by homologous complement. By directly incorporating protectin into membranes of heterologous cells, Meri et al. (1990) found that protectin does not prevent perforin-mediated killing (see OMIM Ref. No. 170280), whereas complement killing is effectively restricted. Thus, cell-mediated killing is unaffected by protectin. Meri et al. (1990) described the functional characteristics of protectin. Much attention has been focused on the Ly6 proteins because they may be involved in lymphocyte activation, and expression of some of them occurs at critical times in the differentiation of lymphocytes. Walsh et al. (1992) reviewed information on CD59, which they characterized as a multifunctional molecule with a role particularly in inhibition of formation of membrane attack complex. They raised the possibility that Ly6 is not a homolog and that the true MAC-inhibiting murine homolog of CD59 had yet to be found.

[7642] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [7643] Meri, S.; Morgan, B. P.; Davies, A.; Daniels, R. H.; Olavesen, M. G.; Waldmann, H.; Lachmann, P. J. : Human protectin (CD59), an 18,000–20,000 MW complement lysis restricting factor, inhibits C5b–8 catalysed insertion of C9 into lipid bilayers. *Immunology* 71: 1–9, 1990. ; and
- [7644] Walsh, L. A.; Tone, M.; Thiru, S.; Waldmann, H. : The CD59 antigen—a multifunctional molecule. *Tissue Antigens* 40: 213–220, 1992.
- [7645] Further studies establishing the function and utilities of CD59 are found in John Hopkins OMIM database record ID 107271, and in cited publications numbered 2906–2915, 683, 2916–2922, 2979–2985, 107 and 2986 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Centaurin, Delta 1 (CENTD1, Accession NM_015230) is another VGAM255 host target gene. CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CENTD1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CENTD1 BINDING SITE1 and CENTD1 BINDING SITE2, designated

SEQ ID:1615 and SEQ ID:2474 respectively, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7646] Another function of VGAM255 is therefore inhibition of Centaurin, Delta 1 (CENTD1, Accession NM_015230), a gene which is involved in cell signaling/communication. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CENTD1. The function of CENTD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM205. NADH Dehydrogenase (ubiquinone) 1 Alpha Subcomplex, 5, 13kDa (NDUFA5, Accession NM_005000) is another VGAM255 host target gene. NDUFA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDUFA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDUFA5 BINDING SITE, designated SEQ ID:1169, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7647] Another function of VGAM255 is therefore inhibition of NADH Dehydrogenase (ubiquinone) 1 Alpha Subcomplex, 5, 13kDa (NDUFA5, Accession NM_005000), a gene which transfers electrons from nadh to the respiratory chain. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDUFA5. The function of NDUFA5 has been established by previous studies. The multisubunit NADH:ubiquinone oxidoreductase (complex I) is the first enzyme complex in the electron transport chain of mitochondria. The iron-sulfur protein (IP) fraction of complex I is made up of 7 subunits, including B13. See NDUFS1 (OMIM Ref. No. 157655). By a combination of EST database screening and PCR, Pata et al. (1997) isolated cDNAs encoding the human homolog of bovine B13. The deduced 116-amino acid human protein has a calculated molecular weight of approximately 13 kD. Human and bovine B13 are 87% identical on the amino acid level. Northern blot analysis revealed that the 1.6-kb B13 mRNA was expressed in all human tissues tested, with the highest levels in heart, skeletal muscle, and brain. Two additional smaller transcripts were also detected. Using Southern blots, Pata et al. (1997) determined that B13 is part of

a multigene family in humans. During the course of a physical mapping project on 11p15.5, Russell et al. (1997) identified sequence with a high degree of similarity to the bovine NADH:ubiquinone oxidoreductase subunit B13. Following up on this lead, they isolated a clone with nucleotide sequence 88% and 83% identical over the predicted open reading frame with bovine and rat B13 subunit genes, respectively. The position of the initiation and termination codons was conserved. To determine the chromosomal localization of the B13 subunit gene, they screened a monochromosome somatic cell hybrid panel and showed that only the hybrid containing human chromosome 7 was positive.

[7648] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7649] Pata, I.; Tensing, K.; Metspalu, A. : A human cDNA encoding the homologue of NADH:ubiquinone oxidoreductase subunit B13. *Biochim. Biophys. Acta* 1350: 115–118, 1997. ; and

[7650] Russell, M. W.; du Manoir, S.; Collins, F. S.; Brody, L. C. : Cloning of the human NADH:ubiquinone oxidoreductase subunit B13: localization to chromosome 7q32 and iden-

tification of a ps.

[7651] Further studies establishing the function and utilities of NDUFA5 are found in John Hopkins OMIM database record ID 601677, and in cited publications numbered 1442–1443 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pre-B-cell Leukemia Transcription Factor 3 (PBX3, Accession NM_006195) is another VGAM255 host target gene. PBX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PBX3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PBX3 BINDING SITE, designated SEQ ID:1279, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7652] Another function of VGAM255 is therefore inhibition of Pre-B-cell Leukemia Transcription Factor 3 (PBX3, Accession NM_006195). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PBX3. Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063) is another VGAM255 host target gene. SCD

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCD BINDING SITE, designated SEQ ID:1178, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7653] Another function of VGAM255 is therefore inhibition of Stearoyl-CoA Desaturase (delta-9-desaturase) (SCD, Accession NM_005063), a gene which functions in the synthesis of unsaturated fatty acids. Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCD. The function of SCD and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM155. Solute Carrier Family 2 (facilitated glucose transporter), Member 2 (SLC2A2, Accession NM_000340) is another VGAM255 host target gene. SLC2A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A2, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A2 BINDING SITE, designated SEQ ID:731, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7654] Another function of VGAM255 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 2 (SLC2A2, Accession NM_000340). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A2. Transcription Factor 7 (T-cell specific, HMG-box) (TCF7, Accession NM_003202) is another VGAM255 host target gene. TCF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF7 BINDING SITE, designated SEQ ID:998, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7655] Another function of VGAM255 is therefore inhibition of Transcription Factor 7 (T-cell specific, HMG-box) (TCF7,

Accession NM_003202). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF7. DKFZP586B0923 (Accession XM_167606) is another VGAM255 host target gene. DKFZP586B0923 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP586B0923, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP586B0923 BINDING SITE, designated SEQ ID:3589, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7656] Another function of VGAM255 is therefore inhibition of DKFZP586B0923 (Accession XM_167606). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP586B0923. DKFZp761K1824 (Accession NM_017597) is another VGAM255 host target gene. DKFZp761K1824 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761K1824, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761K1824 BINDING SITE, designated SEQ ID:1726, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7657] Another function of VGAM255 is therefore inhibition of DKFZp761K1824 (Accession NM_017597). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761K1824. FLJ14624 (Accession XM_049060) is another VGAM255 host target gene. FLJ14624 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14624, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14624 BINDING SITE, designated SEQ ID:2913, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7658] Another function of VGAM255 is therefore inhibition of FLJ14624 (Accession XM_049060). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ14624. GRO3 (Accession XM_031287) is another VGAM255 host target gene. GRO3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRO3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRO3 BINDING SITE, designated SEQ ID:2636, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7659] Another function of VGAM255 is therefore inhibition of GRO3 (Accession XM_031287). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRO3. KIAA0907 (Accession NM_014949) is another VGAM255 host target gene. KIAA0907 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0907, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0907 BINDING SITE, designated SEQ ID:1596, to the nucleotide sequence of

VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7660] Another function of VGAM255 is therefore inhibition of KIAA0907 (Accession NM_014949). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0907. MGC14289 (Accession NM_080660) is another VGAM255 host target gene. MGC14289 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC14289, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14289 BINDING SITE, designated SEQ ID:2382, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7661] Another function of VGAM255 is therefore inhibition of MGC14289 (Accession NM_080660). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14289. NLP_1 (Accession NM_007342) is another VGAM255 host target gene. NLP_1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by NLP_1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLP_1 BINDING SITE, designated SEQ ID:1395, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7662] Another function of VGAM255 is therefore inhibition of NLP_1 (Accession NM_007342). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLP_1. Parvin, Alpha (PARVA, Accession NM_018222) is another VGAM255 host target gene. PARVA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PARVA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PARVA BINDING SITE, designated SEQ ID:1802, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7663] Another function of VGAM255 is therefore inhibition of Parvin, Alpha (PARVA, Accession NM_018222). Accord-

ingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PARVA. PRO2176 (Accession NM_018515) is another VGAM255 host target gene. PRO2176 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO2176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO2176 BINDING SITE, designated SEQ ID:1833, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7664] Another function of VGAM255 is therefore inhibition of PRO2176 (Accession NM_018515). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO2176. Translocase of Inner Mitochondrial Membrane 22 Homolog (yeast) (TIMM22, Accession XM_085739) is another VGAM255 host target gene. TIMM22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMM22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of TIMM22 BINDING SITE, designated SEQ ID:3104, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7665] Another function of VGAM255 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 22 Homolog (yeast) (TIMM22, Accession XM_085739). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM22. LOC143914 (Accession XM_084654) is another VGAM255 host target gene. LOC143914 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143914, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143914 BINDING SITE, designated SEQ ID:3061, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7666] Another function of VGAM255 is therefore inhibition of LOC143914 (Accession XM_084654). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143914. LOC154862 (Accession XM_088061) is another VGAM255 host target gene. LOC154862 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154862, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154862 BINDING SITE, designated SEQ ID:3193, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7667] Another function of VGAM255 is therefore inhibition of LOC154862 (Accession XM_088061). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154862. LOC158314 (Accession XM_098920) is another VGAM255 host target gene. LOC158314 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158314, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158314 BINDING SITE, designated SEQ ID:3386, to the nucleotide sequence of VGAM255 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:590.

[7668] Another function of VGAM255 is therefore inhibition of LOC158314 (Accession XM_098920). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158314. LOC221405 (Accession XM_168138) is another VGAM255 host target gene. LOC221405 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221405 BINDING SITE, designated SEQ ID:3623, to the nucleotide sequence of VGAM255 RNA, herein designated VGAM RNA, also designated SEQ ID:590.

[7669] Another function of VGAM255 is therefore inhibition of LOC221405 (Accession XM_168138). Accordingly, utilities of VGAM255 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221405. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 256 (VGAM256) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7670] VGAM256 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM256 was detected is described hereinabove with reference to Figs. 1–8.

[7671] VGAM256 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7672] VGAM256 gene encodes a VGAM256 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM256 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM256 precursor RNA is designated SEQ ID:242, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:242 is located at position 143051 relative to the genome of Vaccinia Virus.

[7673] VGAM256 precursor RNA folds onto itself, forming

VGAM256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7674] An enzyme complex designated DICER COMPLEX, `dices` the VGAM256 folded precursor RNA into VGAM256 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM256 RNA is designated SEQ ID:591, and is provided hereinbelow with reference to the sequence listing part.

[7675] VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM256 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7676] VGAM256 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM256 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM256 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7677] The complementary binding of VGAM256 RNA, herein designated VGAM RNA, to host target binding sites on VGAM256 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM256 host target RNA into VGAM256 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7678] It is appreciated that VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM256 host target genes. The mRNA of each one of this plurality of VGAM256 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM256 RNA, herein designated VGAM RNA, and which when bound by VGAM256 RNA causes inhibition of translation of respective one or more VGAM256 host target proteins.

[7679] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM256 gene, herein designated VGAM GENE, on one or more VGAM256 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7680] It is yet further appreciated that a function of VGAM256 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM256 correlate with, and may be deduced from, the identity of the host target genes which VGAM256 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[7681] Nucleotide sequences of the VGAM256 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM256 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM256 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM256 are further described hereinbelow with reference to Table 1.

[7682] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM256 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM256 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7683] As mentioned hereinabove with reference to Fig. 1, a function of VGAM256 gene, herein designated VGAM is inhibition of expression of VGAM256 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM256 correlate with, and may be deduced from, the identity of the target genes which VGAM256 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[7684] V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is a VGAM256 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:1209, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:591.

[7685] A function of VGAM256 is therefore inhibition of V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433), a gene which is a putative protein–tyrosine kinase. Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 has been established by previous studies. The YES oncogene is homologous to the gene of the Yamaguchi sarcoma virus. The product of the gene is associated with tyrosine–specific protein kinase activity and its amino acid sequence shows a high degree of homology with that of the SRC gene product of Rous sarcoma virus. Semba et al.

(1985) found in DNA from human embryo fibroblasts 10 EcoRI fragments that hybridized with the Yamaguchi sarcoma virus oncogene. Four of these (designated YES1) were assigned to chromosome 18 and 1 (designated YES2) was assigned to chromosome 6 by a study of human-mouse cell hybrids. (YES2 was later found (Semba et al., 1988) to be a pseudogene of YES1 and to be located at 22q11.2. Semba et al. (1988) stated: 'The failure of proper mapping in our earlier experiment might have been caused by instability of hybrid cell clones.') The other 5 fragments could not be mapped either because hybridization signals were too weak or differentiation from mouse YES fragments was impossible. There was evidence for multiple copies of YES-related genes in the human genome, but only a single RNA species, 4.8 kb long, was found. At least 3 of the human YES gene copies had both introns and exons and 1 gene copy appeared to be a pseudogene. By isotopic in situ hybridization, Yoshida et al. (1985) mapped the YES1 gene to 18q21.3. These workers suggested that the localization is consistent with a role in the pathogenesis of follicular lymphoma, which is frequently associated with a 14;18 translocation with the breakpoint at 18q21 (Fukuhara et al., 1979); see 151430.

Ohno et al. (1987) found that although it is in the same chromosome region as BCL2 (OMIM Ref. No. 151430), the YES gene is intact in cases of follicular lymphoma. Using yeast artificial chromosomes (YACs) containing the YES1 gene as probes and fluorescence in situ hybridization, Silverman et al. (1993) detected a strong signal in the region corresponding to 18p11.3. These YACs were found to contain another 18p11.32 gene, thymidylate synthase (OMIM Ref. No. 188350); the genes were less than 50 kb apart. Overhauser et al. (1993) identified a sequence tagged site (STS) in the YES1 gene and used it in studies of somatic cell hybrids with deletion of various segments of chromosome 18 to map the gene to 18pter-p11.21.

[7686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7687] Semba, K.; Yamanashi, Y.; Nishizawa, M.; Sukegawa, J.; Yoshida, M.; Sasaki, M.; Yamamoto, T.; Toyoshima, K. : Location of the c-yes gene on the human chromosome and its expression in various tissues. Science 227: 1038-1040, 1985. ; and

[7688] Overhauser, J.; Mewar, R.; Rojas, K.; Lia, K.; Kline, A. D.; Silverman, G. A. : STS map of genes and anonymous DNA

fragments on human chromosome 18 using a panel of somatic cell hybrids.

[7689] Further studies establishing the function and utilities of YES1 are found in John Hopkins OMIM database record ID 164880, and in cited publications numbered 703–704, 2762–70 and 360 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARP3 Actin-related Protein 3 Homolog (yeast) (ACTR3, Accession NM_005721) is another VGAM256 host target gene. ACTR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTR3 BINDING SITE, designated SEQ ID:1238, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:591.

[7690] Another function of VGAM256 is therefore inhibition of ARP3 Actin-related Protein 3 Homolog (yeast) (ACTR3, Accession NM_005721). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTR3. GENX–

3414 (Accession NM_003943) is another VGAM256 host target gene. GENX-3414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GENX-3414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GENX-3414 BINDING SITE, designated SEQ ID:1073, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:591.

[7691] Another function of VGAM256 is therefore inhibition of GENX-3414 (Accession NM_003943). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GENX-3414. HT007 (Accession NM_018480) is another VGAM256 host target gene. HT007 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HT007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HT007 BINDING SITE, designated SEQ ID:1832, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:591.

[7692] Another function of VGAM256 is therefore inhibition of HT007 (Accession NM_018480). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HT007. Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964) is another VGAM256 host target gene. SPRY4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPRY4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPRY4 BINDING SITE, designated SEQ ID:2175, to the nucleotide sequence of VGAM256 RNA, herein designated VGAM RNA, also designated SEQ ID:591.

[7693] Another function of VGAM256 is therefore inhibition of Sprouty Homolog 4 (Drosophila) (SPRY4, Accession NM_030964). Accordingly, utilities of VGAM256 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPRY4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 257 (VGAM257)

viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7694] VGAM257 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM257 was detected is described hereinabove with reference to Figs. 1–8.

[7695] VGAM257 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7696] VGAM257 gene encodes a VGAM257 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM257 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM257 precursor RNA is designated SEQ ID:243, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:243 is located at position 142696 relative to the genome of Vaccinia Virus.

[7697] VGAM257 precursor RNA folds onto itself, forming

VGAM257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7698] An enzyme complex designated DICER COMPLEX, `dices` the VGAM257 folded precursor RNA into VGAM257 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM257 RNA is designated SEQ ID:592, and is provided hereinbelow with reference to the sequence listing part.

[7699] VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM257 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7700] VGAM257 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM257 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM257 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7701] The complementary binding of VGAM257 RNA, herein designated VGAM RNA, to host target binding sites on VGAM257 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM257 host target RNA into VGAM257 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7702] It is appreciated that VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM257 host target genes. The mRNA of each one of this plurality of VGAM257 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM257 RNA, herein designated VGAM RNA, and which when bound by VGAM257 RNA causes inhibition of translation of respective one or more VGAM257 host target proteins.

[7703] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM257 gene, herein designated VGAM GENE, on one or more VGAM257 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7704] It is yet further appreciated that a function of VGAM257 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM257 correlate with, and may be deduced from, the identity of the host target genes which VGAM257 binds and inhibits, and the

function of these host target genes, as elaborated herein—below.

[7705] Nucleotide sequences of the VGAM257 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM257 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM257 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM257 are further described hereinbelow with reference to Table 1.

[7706] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM257 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM257 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7707] As mentioned hereinabove with reference to Fig. 1, a function of VGAM257 gene, herein designated VGAM is inhibition of expression of VGAM257 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM257 correlate with, and may be deduced from, the identity of the target genes which VGAM257 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[7708] POF1B (Accession NM_024921) is a VGAM257 host target gene. POF1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POF1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POF1B BINDING SITE, designated SEQ ID:2114, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:592.

[7709] A function of VGAM257 is therefore inhibition of POF1B (Accession NM_024921). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POF1B. RODH-4 (Accession NM_003708) is another VGAM257 host target gene. RODH-4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RODH-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RODH-4 BINDING SITE, designated SEQ ID:1050, to the nucleotide sequence of

VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:592.

[7710] Another function of VGAM257 is therefore inhibition of RODH-4 (Accession NM_003708). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RODH-4. Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168) is another VGAM257 host target gene. SFRS12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS12 BINDING SITE, designated SEQ ID:2472, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:592.

[7711] Another function of VGAM257 is therefore inhibition of Splicing Factor, Arginine/serine-rich 12 (SFRS12, Accession NM_139168). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS12. TCBAP0758 (Accession NM_030973) is another VGAM257 host target

gene. TCBAP0758 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCBAP0758, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCBAP0758 BINDING SITE, designated SEQ ID:2181, to the nucleotide sequence of VGAM257 RNA, herein designated VGAM RNA, also designated SEQ ID:592.

[7712] Another function of VGAM257 is therefore inhibition of TCBAP0758 (Accession NM_030973). Accordingly, utilities of VGAM257 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCBAP0758. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 258 (VGAM258) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7713] VGAM258 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM258 was detected is described

hereinabove with reference to Figs. 1–8.

[7714] VGAM258 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7715] VGAM258 gene encodes a VGAM258 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM258 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM258 precursor RNA is designated SEQ ID:244, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:244 is located at position 141997 relative to the genome of Vaccinia Virus.

[7716] VGAM258 precursor RNA folds onto itself, forming VGAM258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7717] An enzyme complex designated DICER COMPLEX, `dices` the VGAM258 folded precursor RNA into VGAM258 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 88%) nucleotide sequence of VGAM258 RNA is designated SEQ ID:593, and is provided hereinbelow with reference to the sequence listing part.

[7718] VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM258 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7719] VGAM258 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM258 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM258 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM258 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7720] The complementary binding of VGAM258 RNA, herein designated VGAM RNA, to host target binding sites on VGAM258 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM258 host target RNA into VGAM258 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7721] It is appreciated that VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM258 host target genes. The mRNA of each one of this plurality of VGAM258 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM258 RNA, herein designated VGAM RNA, and which when bound by VGAM258 RNA causes inhibition of translation of respective one or more VGAM258 host target proteins.

[7722] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM258 gene, herein designated VGAM GENE, on one or more VGAM258 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7723] It is yet further appreciated that a function of VGAM258 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM258 correlate with, and may be deduced from, the identity of the host target genes which VGAM258 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7724] Nucleotide sequences of the VGAM258 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM258 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM258 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM258 are further described hereinbelow with reference to Table 1.

[7725] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM258 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM258 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7726] As mentioned hereinabove with reference to Fig. 1, a function of VGAM258 gene, herein designated VGAM is inhibition of expression of VGAM258 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM258 correlate with, and may be deduced from, the identity of the target genes which VGAM258 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7727] Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464) is a VGAM258 host target gene. HYOU1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HYOU1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HYOU1 BINDING SITE, designated SEQ ID:2537, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7728] A function of VGAM258 is therefore inhibition of Hypoxia Up-regulated 1 (HYOU1, Accession XM_006464). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HYOU1. Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession NM_002211) is another VGAM258 host target gene. ITGB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITGB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITGB1 BINDING SITE, designated SEQ ID:910, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7729] Another function of VGAM258 is therefore inhibition of Integrin, Beta 1 (fibronectin receptor, beta polypeptide, antigen CD29 includes MDF2, MSK12) (ITGB1, Accession

NM_002211), a gene which acts as a fibronectin receptor. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITGB1. The function of ITGB1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM154. Melanoma Antigen, Family A, 4 (MAGEA4, Accession NM_002362) is another VGAM258 host target gene. MAGEA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAGEA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEA4 BINDING SITE, designated SEQ ID:922, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7730] Another function of VGAM258 is therefore inhibition of Melanoma Antigen, Family A, 4 (MAGEA4, Accession NM_002362), a gene which may play a role in embryonal development and tumor transformation or tumor progression. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with MAGEA4. The function of MAGEA4 has been established by previous studies. Genes of the MAGE-A family are expressed in several types of solid tumors but are silent in normal tissues, with the exception of male germline cells, which do not carry HLA molecules. Therefore, peptides encoded by MAGE-A genes are strictly tumor-specific antigens that can be recognized by CTL and constitute promising targets for immunotherapy. Chambost et al. (2000) found that 5 of 18 samples (28%) from patients with Hodgkin disease expressed MAGE-A4. In tissue sections, staining by a monoclonal antibody that recognizes MAGE-A4 protein was observed in 11 of 53 samples (21%) from patients with Hodgkin disease. In the positive samples, the Reed-Sternberg cells were strongly stained, whereas the surrounding cells were not. These results indicated that Hodgkin disease may be a target for specific immunotherapy involving MAGE-A4 antigens. De Plaen et al. (1994) used human/rodent cell hybrids to map the MAGE family A cluster to Xq26-qter. Rogner et al. (1995) refined the mapping of the MAGE family A cluster to Xq28. The 12 genes are arranged in 3 clusters within 3.5 Mb.

[7731] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [7732] Chambost, H.; Van Baren, N.; Brasseur, F.; Godelaine, D.; Xerri, L.; Landi, S. J.; Theate, I.; Plumas, J.; Spagnoli, G. C.; Michel, G.; Coulie, P. G.; Olive, D. : Expression of gene MAGE-A4 in Reed-Sternberg cells. Blood 95: 3530-3533, 2000. ; and
- [7733] De Plaen, E.; Arden, K.; Traversari, C.; Gaforio, J. J.; Szikora, J.-P.; De Smet, C.; Brasseur, F.; van der Bruggen, P.; Lethe, B.; Lurquin, C.; Brasseur, R.; Chomez, P.; De Backer, O.;
- [7734] Further studies establishing the function and utilities of MAGEA4 are found in John Hopkins OMIM database record ID 300175, and in cited publications numbered 161 and 1640-1641 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339) is another VGAM258 host target gene. PTTG1IP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTTG1IP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of PTTG1IP BINDING SITE, designated SEQ ID:1100, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7735] Another function of VGAM258 is therefore inhibition of Pituitary Tumor-transforming 1 Interacting Protein (PTTG1IP, Accession NM_004339), a gene which facilitates the translocation of PTTG to the nucleus. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTTG1IP. The function of PTTG1IP has been established by previous studies. In the course of constructing a transcript map for chromosome 21, Yaspo et al. (1995) isolated numerous coding segments from 21q22.3, including transcription unit TU6. Yaspo et al. (1998) cloned cDNAs corresponding to TU6 by screening a human fetal thymus cDNA library with a partial cDNA and trapped exon from TU6. Homology searches of sequence databases using the translated sequence did not detect similarities to known proteins, and the authors named the novel gene C21ORF3. The predicted 180-amino acid C21ORF3 protein has features of a type Ia integral membrane protein and contains the tetrapeptide YXRF, a motif

observed in proteins internalized via coated pit-mediated endocytosis. Northern blot analysis detected a 2.69-kb C21ORF3 mRNA in all tissues examined. Using a yeast 2-hybrid screen on a human testis cDNA library with rat pituitary tumor-transforming gene (PTTG; 604147) as bait, Chien and Pei (2000) isolated a cDNA encoding PTTG1IP, which they called PBF (PTTG-binding factor). Sequence analysis predicted that the 179-amino acid PBF protein, which is 92% identical to C21ORF3, contains multiple phosphorylation sites, 5 potential N- and O-glycosylation sites, a potential N-terminal sorting signal, and a C-terminal nuclear localization signal (NLS). Northern and dot blot analysis detected a 2.8-kb PBF transcript in all tissues tested, with highest expression in placenta. Pull-down and coimmunoprecipitation analyses showed that PBF and PTTG interact specifically via their C-terminal regions. Western blot analysis and immunofluorescence microscopy showed that whereas PTTG is expressed primarily in the cytoplasm, PBF is expressed in both the cytoplasm and nucleus. The authors demonstrated that PBF, via its NLS, facilitates the translocation of PTTG to the nucleus. Reporter assay analysis indicated that coexpression of PBF and PTTG induces transcription of basic fibroblast

growth factor (FGF2; 134920).

[7736] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7737] Yaspo, M.-L.; Aaltonen, J.; Horelli-Kuitunen, N.; Peltonen, L.; Lehrach, H. : Cloning of a novel human putative type Ia integral membrane protein mapping to 21q22.3. *Genomics* 49: 133-136, 1998. ; and

[7738] Yaspo, M.-L.; Gellen, L.; Mott, R.; Korn, B.; Nizetic, D.; Poustka, A. M.; Lehrach, H. : Model for a transcript map of human chromosome 21: isolation of new coding sequences from exon an.

[7739] Further studies establishing the function and utilities of PTTG1IP are found in John Hopkins OMIM database record ID 603784, and in cited publications numbered 1867-1869 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580) is another VGAM258 host target gene. RAB27A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB27A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of RAB27A BINDING SITE, designated SEQ ID:1129, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7740] Another function of VGAM258 is therefore inhibition of RAB27A, Member RAS Oncogene Family (RAB27A, Accession NM_004580). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB27A. Sal-like 2 (Drosophila) (SALL2, Accession XM_033473) is another VGAM258 host target gene. SALL2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SALL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL2 BINDING SITE, designated SEQ ID:2671, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7741] Another function of VGAM258 is therefore inhibition of Sal-like 2 (Drosophila) (SALL2, Accession XM_033473). Accordingly, utilities of VGAM258 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with SALL2. Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575) is another VGAM258 host target gene. SFRS7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS7 BINDING SITE, designated SEQ ID:2529, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7742] Another function of VGAM258 is therefore inhibition of Splicing Factor, Arginine/serine-rich 7, 35kDa (SFRS7, Accession XM_002575), a gene which is required for pre-mrna splicing. Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS7. The function of SFRS7 has been established by previous studies. Cavaloc et al. (1994) used a monoclonal antibody to identify a splicing factor of 35 kD which they named 9G8. Based on partial sequence of tryptic peptides, the authors designed degenerate PCR primers and obtained a PCR product

which was used to probe genomic and cDNA libraries. The isolation and characterization of cDNA clones indicated that the 9G8 protein (gene symbol, SFRS7) is a member of the serine/arginine (SR) splicing factor family because it includes an N-terminal RNA binding domain and a C-terminal SR domain. Members of this family are thought to play key roles in alternative splicing. The RNA binding domain of 9G8 is closely related (79 to 71% identity) to those of the SR factors human SRp20 (OMIM Ref. No. 603364) and *Drosophila* RBP1. Immunodepletion of the 9G8 protein from a nuclear extract resulted in the loss of splicing activity. In turn, in vitro-expressed recombinant 9G8 protein rescued the splicing activity of a 9G8-depleted nuclear extract. Popielarz et al. (1995) isolated and characterized the human 9G8 gene. The gene spans 7,745 bp and consists of 8 exons and 7 introns within the coding sequence, thus contrasting with the organization of some other genes of the SR splicing factor family. By isotopic in situ hybridization, they localized the gene to 2p22-p21. The 5-prime flanking region is GC-rich and contains basal promoter sequences and potential regulatory elements. They presented results raising the possibility that alternative splicing of intron 3 provides a mechanism for modu-

lation of the 9G8 function.

[7743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7744] Cavaloc, Y.; Popielarz, M.; Fuchs, J.-P.; Gattoni, R.; Stevenin, J. : Characterization and cloning of the human splicing factor 9G8: a novel 35 kDa factor of the serine/ arginine protein family. EMBO J. 13: 2639–2649, 1994. ; and

[7745] Popielarz, M.; Cavaloc, Y.; Mattei, M.-G.; Gattoni, R.; Stevenin, J. : The gene encoding human splicing factor 9G8: structure, chromosomal localization, and expression of alternatively pro.

[7746] Further studies establishing the function and utilities of SFRS7 are found in John Hopkins OMIM database record ID 600572, and in cited publications numbered 2151–2152 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421) is another VGAM258 host target gene. SLC19A2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SLC19A2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A2 BINDING SITE, designated SEQ ID:2836, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7747] Another function of VGAM258 is therefore inhibition of Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A2. Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158) is another VGAM258 host target gene. C20orf97 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf97, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf97 BINDING SITE, designated SEQ ID:1946, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7748] Another function of VGAM258 is therefore inhibition of

Chromosome 20 Open Reading Frame 97 (C20orf97, Accession NM_021158). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf97. CYB5-M (Accession NM_030579) is another VGAM258 host target gene. CYB5-M BINDING SITE1 and CYB5-M BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYB5-M, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYB5-M BINDING SITE1 and CYB5-M BINDING SITE2, designated SEQ ID:2150 and SEQ ID:3658 respectively, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7749] Another function of VGAM258 is therefore inhibition of CYB5-M (Accession NM_030579). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYB5-M. FLJ10853 (Accession NM_018246) is another VGAM258 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated SEQ ID:1804, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7750] Another function of VGAM258 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. FLJ14327 (Accession NM_024912) is another VGAM258 host target gene. FLJ14327 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14327 BINDING SITE, designated SEQ ID:2111, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7751] Another function of VGAM258 is therefore inhibition of FLJ14327 (Accession NM_024912). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ14327. FLJ14681 (Accession NM_032824) is another VGAM258 host target gene. FLJ14681 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ14681, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14681 BINDING SITE, designated SEQ ID:2285, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7752] Another function of VGAM258 is therefore inhibition of FLJ14681 (Accession NM_032824). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14681. Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758) is another VGAM258 host target gene. HNRPA3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HNRPA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPA3 BINDING SITE, designated SEQ

ID:1245, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7753] Another function of VGAM258 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein A3 (HNRPA3, Accession NM_005758). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPA3. KIAA0426 (Accession NM_014724) is another VGAM258 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:1532, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7754] Another function of VGAM258 is therefore inhibition of KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA0594 (Accession XM_036117) is another

VGAM258 host target gene. KIAA0594 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0594, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0594 BINDING SITE, designated SEQ ID:2707, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7755] Another function of VGAM258 is therefore inhibition of KIAA0594 (Accession XM_036117). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0594. KIAA0635 (Accession NM_014645) is another VGAM258 host target gene. KIAA0635 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0635 BINDING SITE, designated SEQ ID:1513, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7756] Another function of VGAM258 is therefore inhibition of KIAA0635 (Accession NM_014645). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0635. PDZ Domain Containing 2 (PDZD2, Accession XM_087705) is another VGAM258 host target gene. PDZD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PDZD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZD2 BINDING SITE, designated SEQ ID:3181, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7757] Another function of VGAM258 is therefore inhibition of PDZ Domain Containing 2 (PDZD2, Accession XM_087705). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZD2. PP1628 (Accession NM_025201) is another VGAM258 host target gene. PP1628 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by

PP1628, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1628 BINDING SITE, designated SEQ ID:2145, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7758] Another function of VGAM258 is therefore inhibition of PP1628 (Accession NM_025201). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1628. TIP120A (Accession NM_018448) is another VGAM258 host target gene. TIP120A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP120A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP120A BINDING SITE, designated SEQ ID:1829, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7759] Another function of VGAM258 is therefore inhibition of TIP120A (Accession NM_018448). Accordingly, utilities of

VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP120A. LOC220988 (Accession XM_165561) is another VGAM258 host target gene. LOC220988 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220988, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220988 BINDING SITE, designated SEQ ID:3501, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7760] Another function of VGAM258 is therefore inhibition of LOC220988 (Accession XM_165561). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220988. LOC221337 (Accession XM_166387) is another VGAM258 host target gene. LOC221337 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221337, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC221337 BINDING SITE, designated SEQ ID:3555, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7761] Another function of VGAM258 is therefore inhibition of LOC221337 (Accession XM_166387). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221337. LOC257017 (Accession XM_173227) is another VGAM258 host target gene. LOC257017 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257017 BINDING SITE, designated SEQ ID:3737, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7762] Another function of VGAM258 is therefore inhibition of LOC257017 (Accession XM_173227). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257017. LOC90829 (Accession XM_034325) is another VGAM258 host target gene. LOC90829 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90829 BINDING SITE, designated SEQ ID:2680, to the nucleotide sequence of VGAM258 RNA, herein designated VGAM RNA, also designated SEQ ID:593.

[7763] Another function of VGAM258 is therefore inhibition of LOC90829 (Accession XM_034325). Accordingly, utilities of VGAM258 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90829. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 259 (VGAM259) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7764] VGAM259 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM259 was detected is described hereinabove with reference to Figs. 1-8.

[7765] VGAM259 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7766] VGAM259 gene encodes a VGAM259 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM259 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM259 precursor RNA is designated SEQ ID:245, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:245 is located at position 144258 relative to the genome of Vaccinia Virus.

[7767] VGAM259 precursor RNA folds onto itself, forming VGAM259 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[7768] An enzyme complex designated DICER COMPLEX, `dices` the VGAM259 folded precursor RNA into VGAM259 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of VGAM259 RNA is designated SEQ ID:594, and is provided hereinbelow with reference to the sequence listing part.

[7769] VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM259 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7770] VGAM259 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM259 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM259 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM259 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7771] The complementary binding of VGAM259 RNA, herein designated VGAM RNA, to host target binding sites on VGAM259 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM259 host target RNA into VGAM259 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7772] It is appreciated that VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM259 host target genes. The mRNA of each one of this plurality of VGAM259 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM259 RNA, herein designated VGAM RNA, and which when bound by VGAM259 RNA causes inhibition of translation of respective one or more VGAM259 host target proteins.

[7773] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM259 gene, herein designated VGAM GENE, on one or more VGAM259 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7774] It is yet further appreciated that a function of VGAM259 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM259 correlate with, and may be deduced from, the identity of the host target genes which VGAM259 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7775] Nucleotide sequences of the VGAM259 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM259 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM259 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM259 are further described hereinbelow with reference to Table 1.

[7776] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM259 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM259 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7777] As mentioned hereinabove with reference to Fig. 1, a function of VGAM259 gene, herein designated VGAM is inhibition of expression of VGAM259 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM259 correlate with, and may be deduced from, the identity of the target genes which VGAM259 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7778] KIAA0268 (Accession XM_046126) is a VGAM259 host target gene. KIAA0268 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0268 BINDING SITE, designated SEQ ID:2874, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:594.

[7779] A function of VGAM259 is therefore inhibition of KIAA0268 (Accession XM_046126). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0268. KIAA1255 (Accession XM_040626) is another VGAM259 host target gene. KIAA1255 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1255, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1255 BINDING SITE, designated SEQ ID:2783, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:594.

[7780] Another function of VGAM259 is therefore inhibition of KIAA1255 (Accession XM_040626). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1255. MGC5370 (Accession NM_032739) is another

VGAM259 host target gene. MGC5370 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5370, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5370 BINDING SITE, designated SEQ ID:2275, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:594.

[7781] Another function of VGAM259 is therefore inhibition of MGC5370 (Accession NM_032739). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5370. UK114 (Accession NM_005836) is another VGAM259 host target gene. UK114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UK114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UK114 BINDING SITE, designated SEQ ID:1255, to the nucleotide sequence of VGAM259 RNA, herein designated VGAM RNA, also designated SEQ ID:594.

- [7782] Another function of VGAM259 is therefore inhibition of UK114 (Accession NM_005836). Accordingly, utilities of VGAM259 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UK114. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 260 (VGAM260) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [7783] VGAM260 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM260 was detected is described hereinabove with reference to Figs. 1–8.
- [7784] VGAM260 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [7785] VGAM260 gene encodes a VGAM260 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM260 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM260 precursor RNA is designated SEQ ID:246, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:246 is located at position 145827 relative to the genome of Vaccinia Virus.

[7786] VGAM260 precursor RNA folds onto itself, forming VGAM260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7787] An enzyme complex designated DICER COMPLEX, `dices` the VGAM260 folded precursor RNA into VGAM260 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 89%) nucleotide se-

quence of VGAM260 RNA is designated SEQ ID:595, and is provided hereinbelow with reference to the sequence listing part.

[7788] VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM260 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7789] VGAM260 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM260 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM260 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7790] The complementary binding of VGAM260 RNA, herein designated VGAM RNA, to host target binding sites on VGAM260 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM260 host target RNA into VGAM260 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7791] It is appreciated that VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM260 host target genes. The mRNA of each one of this plurality of VGAM260 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM260 RNA, herein designated VGAM RNA, and which when bound by VGAM260 RNA causes inhibition of translation of respective one or more VGAM260 host target proteins.

[7792] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM260 gene, herein designated VGAM GENE, on one or more VGAM260 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7793] It is yet further appreciated that a function of VGAM260 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM260 correlate with, and may be deduced from, the identity of the host target genes which VGAM260 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[7794] Nucleotide sequences of the VGAM260 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM260 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM260 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM260 are further described hereinbelow with reference to Table 1.

[7795] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM260 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM260 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7796] As mentioned hereinabove with reference to Fig. 1, a function of VGAM260 gene, herein designated VGAM is inhibition of expression of VGAM260 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM260 correlate with, and may be deduced from, the identity of the target genes which VGAM260 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7797] Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841) is a VGAM260 host target gene. OSBPL8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OSBPL8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL8 BINDING SITE, designated SEQ ID:1927, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:595.

[7798] A function of VGAM260 is therefore inhibition of Oxysterol Binding Protein-like 8 (OSBPL8, Accession NM_020841). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL8. LOC147463

(Accession XM_085799) is another VGAM260 host target gene. LOC147463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147463 BINDING SITE, designated SEQ ID:3109, to the nucleotide sequence of VGAM260 RNA, herein designated VGAM RNA, also designated SEQ ID:595.

[7799] Another function of VGAM260 is therefore inhibition of LOC147463 (Accession XM_085799). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147463. LOC151201 (Accession XM_098021) is another VGAM260 host target gene. LOC151201 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151201, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151201 BINDING SITE, designated SEQ ID:3340, to the nucleotide sequence of VGAM260 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:595.

[7800] Another function of VGAM260 is therefore inhibition of LOC151201 (Accession XM_098021). Accordingly, utilities of VGAM260 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151201. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 261 (VGAM261) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7801] VGAM261 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM261 was detected is described hereinabove with reference to Figs. 1–8.

[7802] VGAM261 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7803] VGAM261 gene encodes a VGAM261 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM261 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM261 precursor RNA is designated SEQ ID:247, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:247 is located at position 145163 relative to the genome of Vaccinia Virus.

[7804] VGAM261 precursor RNA folds onto itself, forming VGAM261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7805] An enzyme complex designated DICER COMPLEX, `dices` the VGAM261 folded precursor RNA into VGAM261 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM261 RNA is designated SEQ ID:596, and is provided hereinbelow with reference to the sequence listing part.

[7806] VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM261 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[7807] VGAM261 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM261 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM261 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7808] The complementary binding of VGAM261 RNA, herein designated VGAM RNA, to host target binding sites on VGAM261 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM261 host target RNA into VGAM261 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7809] It is appreciated that VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM261 host target genes. The mRNA of

each one of this plurality of VGAM261 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM261 RNA, herein designated VGAM RNA, and which when bound by VGAM261 RNA causes inhibition of translation of respective one or more VGAM261 host target proteins.

[7810] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM261 gene, herein designated VGAM GENE, on one or more VGAM261 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[7811] It is yet further appreciated that a function of VGAM261 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM261 correlate with, and may be deduced from, the identity of the host target genes which VGAM261 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[7812] Nucleotide sequences of the VGAM261 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM261 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM261 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM261 are further described hereinbelow with reference to Table 1.

[7813] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM261 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM261 RNA, herein desig—

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[7814] As mentioned hereinabove with reference to Fig. 1, a function of VGAM261 gene, herein designated VGAM is inhibition of expression of VGAM261 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM261 correlate with, and may be deduced from, the identity of the target genes which VGAM261 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7815] JJAZ1 (Accession NM_015355) is a VGAM261 host target gene. JJAZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by JJAZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of JJAZ1 BINDING SITE, designated SEQ ID:1621, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7816] A function of VGAM261 is therefore inhibition of JJAZ1 (Accession NM_015355), a gene which is a zinc finger protein. Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with JJAZ1. The function of JJAZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM187.

Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM_003032) is another VGAM261 host target gene. SIAT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SIAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIAT1 BINDING SITE, designated SEQ ID:986, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7817] Another function of VGAM261 is therefore inhibition of Sialyltransferase 1 (beta-galactoside alpha-2,6-sialyltransferase) (SIAT1, Accession NM_003032), a gene which transfers sialic acid from the donor of substrate cmp-sialic acid to galactose containing acceptor substrates. Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIAT1. The function of SIAT1

has been established by previous studies. Much interest in the role and regulation of beta-galactoside alpha-2,6-sialyltransferase (EC 2.4.99.1) in B lymphocytes stemmed from its relation to CDw75, a human leukocyte cell-surface antigen expressed in mature and activated B cells but not in B cells at earlier stages of development or in plasma cells. SiaT-1 is required for the elaboration of the CDw75 cell-surface epitope. Grundmann et al. (1990) reported the complete cDNA sequence corresponding to the SIAT1 gene on the basis of cDNA isolated from a human placental lambda-gt10 library. By Southern analysis of somatic cell hybrids and by in situ hybridization, Wang et al. (1993) demonstrated that the SIAT1 gene is located on 3q21-q28. Comparative analysis of the human and rat sequences demonstrated precise conservation of the intron/exon boundaries throughout the coding domains. Furthermore, there was extensive interspecies sequence similarity in some of the exons that contained information only for the 5-prime leader regions.

[7818] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7819] Grundmann, U.; Nerlich, C.; Rein, T.; Zettlmeissl, G. :

Complete cDNA sequence encoding human beta-galactoside alpha-2,6-sialyltransferase. Nucleic Acids Res. 18: 667 only, 1990. ; and

[7820] Wang, X.; Vertino, A.; Eddy, R. L.; Byers, M. G.; Jani-Sait, S. N.; Shows, T. B.; Lau, J. T. Y. : Chromosome mapping and organization of the human beta-galactoside alpha-2,6-sialyltrans.

[7821] Further studies establishing the function and utilities of SIAT1 are found in John Hopkins OMIM database record ID 109675, and in cited publications numbered 869-870 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, H⁺ Transporting, Lysosomal V0 Subunit A Isoform 1 (ATP6V0A1, Accession NM_005177) is another VGAM261 host target gene. ATP6V0A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V0A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V0A1 BINDING SITE, designated SEQ ID:1191, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7822] Another function of VGAM261 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal V0 Subunit A Iso-form 1 (ATP6V0A1, Accession NM_005177). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V0A1. FLJ21313 (Accession NM_023927) is another VGAM261 host target gene. FLJ21313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21313 BINDING SITE, designated SEQ ID:2038, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7823] Another function of VGAM261 is therefore inhibition of FLJ21313 (Accession NM_023927). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21313. FLJ23548 (Accession NM_024590) is another VGAM261 host target gene. FLJ23548 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23548, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23548 BINDING SITE, designated SEQ ID:2068, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7824] Another function of VGAM261 is therefore inhibition of FLJ23548 (Accession NM_024590). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23548. LOC196510 (Accession XM_113738) is another VGAM261 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:3414, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7825] Another function of VGAM261 is therefore inhibition of LOC196510 (Accession XM_113738). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC196510. LOC200220 (Accession XM_114157) is another VGAM261 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200220 BINDING SITE, designated SEQ ID:3443, to the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7826] Another function of VGAM261 is therefore inhibition of LOC200220 (Accession XM_114157). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC222234 (Accession XM_168558) is another VGAM261 host target gene. LOC222234 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222234, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222234 BINDING SITE, designated SEQ ID:3645, to

the nucleotide sequence of VGAM261 RNA, herein designated VGAM RNA, also designated SEQ ID:596.

[7827] Another function of VGAM261 is therefore inhibition of LOC222234 (Accession XM_168558). Accordingly, utilities of VGAM261 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222234. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 262 (VGAM262) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7828] VGAM262 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM262 was detected is described hereinabove with reference to Figs. 1–8.

[7829] VGAM262 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7830] VGAM262 gene encodes a VGAM262 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM262 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM262 precursor RNA is designated SEQ ID:248, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:248 is located at position 147193 relative to the genome of Vaccinia Virus.

[7831] VGAM262 precursor RNA folds onto itself, forming VGAM262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7832] An enzyme complex designated DICER COMPLEX, `dices` the VGAM262 folded precursor RNA into VGAM262 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM262 RNA is designated SEQ ID:597, and is provided hereinbelow with reference to the sequence listing part.

[7833] VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM262 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7834] VGAM262 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM262 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM262 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7835] The complementary binding of VGAM262 RNA, herein designated VGAM RNA, to host target binding sites on VGAM262 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM262 host target RNA into VGAM262 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7836] It is appreciated that VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM262 host target genes. The mRNA of each one of this plurality of VGAM262 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM262 RNA, herein designated VGAM RNA, and which when bound by VGAM262 RNA causes inhibition of translation of respective one or more VGAM262 host target proteins.

[7837] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM262 gene, herein designated VGAM GENE, on one or more VGAM262 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[7838] It is yet further appreciated that a function of VGAM262 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM262 correlate with, and may be deduced from, the identity of the host target genes which VGAM262 binds and inhibits, and the function of these host target genes, as elaborated herein–below.

[7839] Nucleotide sequences of the VGAM262 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM262 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM262 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM262 are further described hereinbelow with reference to Table 1.

[7840] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM262 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM262 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7841] As mentioned hereinabove with reference to Fig. 1, a function of VGAM262 gene, herein designated VGAM is inhibition of expression of VGAM262 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM262 correlate with, and may be deduced from, the identity of the target genes which VGAM262 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7842] Cyclin-dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM_004064) is a VGAM262 host target gene. CDKN1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDKN1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKN1B BINDING SITE, designated SEQ ID:1082, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7843] A function of VGAM262 is therefore inhibition of Cyclin-

dependent Kinase Inhibitor 1B (p27, Kip1) (CDKN1B, Accession NM_004064), a gene which is involved in G1 arrest and may mediate TGF beta-induced G1 arrest. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKN1B. The function of CDKN1B has been established by previous studies. Stegmaier et al. (1995) studied loss of heterozygosity (LOH) in the region 12p13-p12 in acute lymphoblastic leukemia; this chromosomal region often shows deletion in such patients. In 15% of informative patients, there was evidence of LOH of the TEL locus (OMIM Ref. No. 600618) which was not evident on cytogenetic analysis. Detailed examination of patients with LOH showed that the critically deleted region included a second candidate tumor suppressor gene, referred to by them as KIP1, which encodes the cyclin-dependent kinase inhibitor previously called p27 (Toyoshima and Hunter, 1994 and Polyak et al., 1994). Based on the STS content of TEL-positive YACs, Stegmaier et al. (1995) reported that KIP1 and TEL were in close proximity. Apoptosis of human endothelial cells after growth factor deprivation is associated with rapid and dramatic upregulation of cyclin A-associated CDK2 activity. Levkau et al. (1998) showed that

in apoptotic cells the carboxyl-termini of the CDK inhibitors CDKN1A (OMIM Ref. No. 116899) and CDKN1B are truncated by specific cleavage. The enzyme involved in this cleavage is CASP3 (OMIM Ref. No. 600636) and/or a CASP3-like caspase. After cleavage, CDKN1A loses its nuclear localization sequence and exits the nucleus. Cleavage of CDKN1A and CDKN1B resulted in a substantial reduction in their association with nuclear cyclin-CDK2 complexes, leading to a dramatic induction of CDK2 activity. Dominant-negative CDK2, as well as a mutant CDKN1A resistant to caspase cleavage, partially suppressed apoptosis. These data suggested that CDK2 activation, through caspase-mediated cleavage of CDK inhibitors, may be instrumental in the execution of apoptosis following caspase activation.

[7844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7845] Levkau, B.; Koyama, H.; Raines, E. W.; Clurman, B. E.; Herren, B.; Orth, K.; Roberts, J. M.; Ross, R. : Cleavage of p21(Cip1/Waf1) and p27(Kip1) mediates apoptosis in endothelial cells through activation of Cdk2: role of a caspase cascade. *Molec. Cell* 1: 553-563, 1998. ; and

- [7847] Further studies establishing the function and utilities of CDKN1B are found in John Hopkins OMIM database record ID 600778, and in cited publications numbered 1318, 2223-2226, 1629, 2232-2233, 2860, 2235-2236, 1056, 223 and 2238 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3, Accession NM_004386) is another VGAM262 host target gene. CSPG3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSPG3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSPG3 BINDING SITE, designated SEQ ID:1107, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.
- [7848] Another function of VGAM262 is therefore inhibition of Chondroitin Sulfate Proteoglycan 3 (neurocan) (CSPG3,

Accession NM_004386), a gene which may play a role in modulating cell adhesion and migration. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSPG3. The function of CSPG3 has been established by previous studies. Neurocan was first described in the early postnatal rat brain where it accounts for 20 to 30% of the total chondroitin sulfate proteoglycan. Rauch et al. (1992) cloned the rat cDNA using degenerate primers based on partial amino acid sequence of immunoaffinity-purified protein. The mouse neurocan cDNA encodes a deduced 1,257-amino acid protein with a predicted molecular mass of 136 kD. The large protein is processed into a smaller form in the adult brain. The predicted protein has a 22-amino acid signal peptide followed by an immunoglobulin-like domain and repeating motifs characteristic of the hyaluronic acid-binding region of aggregating proteoglycans. The C terminus shows approximately 60% identity to the fibroblast and cartilage proteoglycans versican (OMIM Ref. No. 118661) and aggrecan (OMIM Ref. No. 155760). Northern blots detected a 7.5-kb transcript from 4-day and adult rat brains Prange et al. (1998) cloned human neurocan cDNAs from infant and adult

brain cDNA libraries. The deduced 1,321-amino acid protein shares 63% sequence identity with both mouse and rat neurocan proteins. Like other known proteoglycans, its N terminus contains an immunoglobulin domain and a series of hyaluronic acid-binding tandem repeats, and its C terminus contains an EGF-like domain, a lectin-like domain, and a complement regulatory-like domain. Northern blot analysis detected expression of a 7.5-kb transcript in fetal and adult tissues from all brain regions tested

[7849] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7850] Rauch, U.; Grimpe, B.; Kulbe, G.; Arnold-Ammer, I.; Beier, D. R.; Fassler, R. : Structure and chromosomal localization of the mouse neurocan gene. *Genomics* 28: 405-410, 1995. ; and

[7851] Prange, C. K.; Pennacchio, L. A.; Lieuallen, K.; Fan, W.; Lennon, G. G. : Characterization of the human neurocan gene, CSPG3. *Gene* 221: 199-205, 1998.

[7852] Further studies establishing the function and utilities of CSPG3 are found in John Hopkins OMIM database record ID 600826, and in cited publications numbered

1779–1782 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024) is another VGAM262 host target gene. ITSN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITSN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITSN1 BINDING SITE, designated SEQ ID:981, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7853] Another function of VGAM262 is therefore inhibition of Intersectin 1 (SH3 domain protein) (ITSN1, Accession NM_003024), a gene which may be involved in endocytosis and synaptic vesicle recycling. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITSN1. The function of ITSN1 has been established by previous studies. See 147265. Ozcelik et al. (1991) found that a cDNA probe for ITPR3 hybridized to DNA from hybrid cells containing human chromosome 6. In one hybrid that carried 6pter–p21, in the absence of an intact copy of this

chromosome, hybridization was observed, thus mapping the gene to 6pter-p21. ITPR3 transduces many hormonal signals that regulate Ca^{2+} -dependent processes in the intestinal epithelium. Maranto (1994) described complete sequence of the ITPR3 polypeptide (2,671 amino acids). Primary structure analysis indicated a pattern of conserved and variable regions, characteristic of the particular gene family. Immunocytochemical localization in the intestine was determined. Yamamoto-Hino et al. (1994) likewise mapped the ITPR3 gene to chromosome 6, specifically to 6p21, by isotopic in situ hybridization. They showed that the type 3 receptor was present in all hematopoietic and lymphoma cell lines tested

[7854] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7855] Maranto, A. R. : Primary structure, ligand binding, and localization of the human type 3 inositol

1,4,5-trisphosphate receptor expressed in intestinal epithelium. J. Biol. Chem. 269: 1222-1230, 1994. ; and

[7856] Ozcelik, T.; Suedhof, T. C.; Francke, U. : The genes for inositol 1,4,5-triphosphate receptors 1 (ITPR1) and 3 (ITPR3) are localized on human chromosomes 3p and

6pter-p21, respectively.

[7857] Further studies establishing the function and utilities of ITSN1 are found in John Hopkins OMIM database record ID 602442, and in cited publications numbered 1295-1296, 134 and 1351 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM262 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:1937, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7858] Another function of VGAM262 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL and its association with various dis-

eases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM196. Mediterranean Fever (MEFV, Accession NM_000243) is another VGAM262 host target gene. MEFV BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MEFV, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE, designated SEQ ID:719, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7859] Another function of VGAM262 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM_000243). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176) is another VGAM262 host target gene. NR3C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NR3C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NR3C1 BINDING SITE, designated SEQ ID:716, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7860] Another function of VGAM262 is therefore inhibition of Nuclear Receptor Subfamily 3, Group C, Member 1 (glucocorticoid receptor) (NR3C1, Accession NM_000176). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR3C1. Transcriptional Intermediary Factor 1 (TIF1, Accession XM_016701) is another VGAM262 host target gene. TIF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIF1 BINDING SITE, designated SEQ ID:2564, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7861] Another function of VGAM262 is therefore inhibition of Transcriptional Intermediary Factor 1 (TIF1, Accession

XM_016701), a gene which mediates the activation function (AF-2) of nuclear estrogen receptor. Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIF1. The function of TIF1 has been established by previous studies. Hormonal regulation of gene activity is mediated by nuclear receptors acting as ligand-activated transcription factors. The activity of the ligand-dependent activation function, or AF2, of the receptors requires intermediary factors that interact with the AF2-activating domain, a C-terminal region that is highly conserved in the nuclear receptor family. Thenot et al. (1997) isolated human breast cancer cell cDNAs that encode transcription intermediary factor-1 (TIF1), a protein that is able to bind to the AF2-activating domain of the estrogen receptor (ESR; e.g., 133430). The deduced 1,013-amino acid TIF1 protein, which is more than 92% conserved with mouse Tif1, contains several domains: a RING finger, B-box fingers, a coiled-coil domain, a PHD homeodomain finger, and a bromodomain. A 26-amino acid region of TIF1 is sufficient for its hormone-dependent binding to the ESR. Thenot et al. (1997) demonstrated that the AF2-activating domain of ESR is required but not sufficient for the bind-

ing of TIF1, that TIF1 association with DNA-bound ESR requires the presence of estradiol, and that TIF1 interacts selectively with different nuclear receptors. The authors identified a cDNA variant that encodes a TIF1 isoform containing a 34-amino acid insertion. Northern blot analysis detected a major 4.5-kb transcript in MCF7 breast cancer cells. Fusion of PML (OMIM Ref. No. 102578) and TIF1A to RARA (OMIM Ref. No. 180240) and BRAF (OMIM Ref. No. 164757), respectively, results in the production of PML-RAR-alpha and TIF1-alpha-B-RAF (T18) oncoproteins. Zhong et al. (1999) showed that PML, TIF1-alpha, and RXR-alpha (OMIM Ref. No. 180245)/RAR-alpha function together in a retinoic acid-dependent transcription complex. Zhong et al. (1999) found that PML acts as a ligand-dependent coactivator of RXR-alpha/RARA-alpha. PML interacts with TIF1-alpha and CREB-binding protein (CBP; 600140). In PML -/- cells, the retinoic acid-dependent induction of genes such as RARB2 and the ability of TIF1-alpha and CBP to act as transcriptional coactivators on retinoic acid are impaired. Zhong et al. (1999) showed that both PML and TIF1-alpha are growth suppressors required for the growth-inhibitory activity of retinoic acid. T18, similar to PML-RAR-alpha, disrupts the

retinoic acid-dependent activity of this complex in a dominant-negative manner, resulting in a growth advantage. PML-RAR-alpha was the first example of an oncoprotein generated by the fusion of 2 molecules participating in the same pathway, specifically the fusion of a transcription factor to one of its own cofactors. Since the PML and RAR-alpha pathways converge at the transcriptional level, there is no need for a double-dominant-negative product to explain the pathogenesis of acute promyelocytic leukemia, or APL. Beckstead et al. (2001) found that the *Drosophila* 'bonus' (bon) gene encodes a homolog of the vertebrate TIF1 transcriptional cofactors. Bon is required for male viability, molting, and numerous events in metamorphosis, including leg elongation, bristle development, and pigmentation. Most of these processes are associated with genes that are implicated in the ecdysone pathway, a nuclear hormone receptor pathway required throughout *Drosophila* development. Bon is associated with sites on the polytene chromosomes and can interact with numerous *Drosophila* nuclear receptor proteins. In vivo, bon behaves as a transcriptional inhibitor.

[7862] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [7863] Zhong, S.; Delva, L.; Rachez, C.; Cenciarelli, C.; Gandini, D.; Zhang, H.; Kalantry, S.; Freedman, L. P.; Pandolfi, P. P. : A RA-dependent, tumour-growth suppressive transcription complex is the target of the PML-RAR-alpha and T18 oncoproteins. *Nature Genet.* 23: 287-295, 1999. ; and

- [7865] Further studies establishing the function and utilities of TIF1 are found in John Hopkins OMIM database record ID 603406, and in cited publications numbered 1202, 1203-1204, 144 and 2606 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM_014670) is another VGAM262 host target gene. BZW1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BZW1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BZW1 BINDING SITE, designated SEQ ID:1516,

to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7866] Another function of VGAM262 is therefore inhibition of Basic Leucine Zipper and W2 Domains 1 (BZW1, Accession NM_014670). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BZW1. FLJ10998 (Accession NM_018294) is another VGAM262 host target gene. FLJ10998 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10998, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10998 BINDING SITE, designated SEQ ID:1811, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7867] Another function of VGAM262 is therefore inhibition of FLJ10998 (Accession NM_018294). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10998. FLJ12409 (Accession NM_025105) is another VGAM262 host target gene. FLJ12409 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ12409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12409 BINDING SITE, designated SEQ ID:2137, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7868] Another function of VGAM262 is therefore inhibition of FLJ12409 (Accession NM_025105). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12409. FLJ32356 (Accession NM_144671) is another VGAM262 host target gene. FLJ32356 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32356, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32356 BINDING SITE, designated SEQ ID:2492, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7869] Another function of VGAM262 is therefore inhibition of

FLJ32356 (Accession NM_144671). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32356. GRP3 (Accession NM_015376) is another VGAM262 host target gene. GRP3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GRP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRP3 BINDING SITE, designated SEQ ID:1624, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7870] Another function of VGAM262 is therefore inhibition of GRP3 (Accession NM_015376). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRP3. KIAA0210 (Accession NM_014744) is another VGAM262 host target gene. KIAA0210 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0210, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0210 BINDING SITE, designated SEQ ID:1538, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7871] Another function of VGAM262 is therefore inhibition of KIAA0210 (Accession NM_014744). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0210. MGC2477 (Accession NM_024099) is another VGAM262 host target gene. MGC2477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2477 BINDING SITE, designated SEQ ID:2054, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7872] Another function of VGAM262 is therefore inhibition of MGC2477 (Accession NM_024099). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2477. MGC2742 (Accession NM_023938) is another

VGAM262 host target gene. MGC2742 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC2742, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2742 BINDING SITE, designated SEQ ID:2039, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7873] Another function of VGAM262 is therefore inhibition of MGC2742 (Accession NM_023938). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2742. MRF2 (Accession XM_084482) is another VGAM262 host target gene. MRF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRF2 BINDING SITE, designated SEQ ID:3056, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7874] Another function of VGAM262 is therefore inhibition of MRF2 (Accession XM_084482). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRF2. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446) is another VGAM262 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:1213, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7875] Another function of VGAM262 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P2RXL1. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM262 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3` un-

translated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:2844, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7876] Another function of VGAM262 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. LOC151579 (Accession XM_045290) is another VGAM262 host target gene. LOC151579 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151579 BINDING SITE, designated SEQ ID:2859, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7877] Another function of VGAM262 is therefore inhibition of

LOC151579 (Accession XM_045290). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151579. LOC51312 (Accession NM_018579) is another VGAM262 host target gene. LOC51312 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC51312, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51312 BINDING SITE, designated SEQ ID:1849, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7878] Another function of VGAM262 is therefore inhibition of LOC51312 (Accession NM_018579). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51312. LOC91574 (Accession XM_039310) is another VGAM262 host target gene. LOC91574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC91574 BINDING SITE, designated SEQ ID:2751, to the nucleotide sequence of VGAM262 RNA, herein designated VGAM RNA, also designated SEQ ID:597.

[7879] Another function of VGAM262 is therefore inhibition of LOC91574 (Accession XM_039310). Accordingly, utilities of VGAM262 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91574. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 263 (VGAM263) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7880] VGAM263 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM263 was detected is described hereinabove with reference to Figs. 1–8.

[7881] VGAM263 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[7882] VGAM263 gene encodes a VGAM263 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM263 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM263 precursor RNA is designated SEQ ID:249, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:249 is located at position 147919 relative to the genome of Vaccinia Virus.

[7883] VGAM263 precursor RNA folds onto itself, forming VGAM263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7884] An enzyme complex designated DICER COMPLEX, `dices` the VGAM263 folded precursor RNA into VGAM263 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM263 RNA is designated SEQ ID:598, and is provided hereinbelow with reference to the sequence listing part.

[7885] VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM263 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7886] VGAM263 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM263 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM263 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7887] The complementary binding of VGAM263 RNA, herein designated VGAM RNA, to host target binding sites on VGAM263 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM263 host target RNA into VGAM263 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7888] It is appreciated that VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM263 host target genes. The mRNA of each one of this plurality of VGAM263 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM263 RNA, herein designated VGAM RNA, and which when bound by VGAM263 RNA causes inhibition of translation of respective one or more VGAM263 host target proteins.

[7889] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM263 gene, herein designated VGAM GENE, on one or more VGAM263 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7890] It is yet further appreciated that a function of VGAM263 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM263 correlate with, and may be deduced from, the identity of the host target genes which VGAM263 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7891] Nucleotide sequences of the VGAM263 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM263 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM263 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM263 are further described hereinbelow with reference to Table 1.

[7892] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM263 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM263 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7893] As mentioned hereinabove with reference to Fig. 1, a function of VGAM263 gene, herein designated VGAM is inhibition of expression of VGAM263 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM263 correlate with, and may be deduced from, the identity of the target genes which VGAM263 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7894] Mab-21-like 2 (C. elegans) (MAB21L2, Accession NM_006439) is a VGAM263 host target gene. MAB21L2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MAB21L2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAB21L2 BINDING SITE, designated SEQ ID:1301, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ

ID:598.

[7895] A function of VGAM263 is therefore inhibition of Mab-21-like 2 (*C. elegans*) (MAB21L2, Accession NM_006439). Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAB21L2. LOC220672 (Accession XM_017177) is another VGAM263 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:2565, to the nucleotide sequence of VGAM263 RNA, herein designated VGAM RNA, also designated SEQ ID:598.

[7896] Another function of VGAM263 is therefore inhibition of LOC220672 (Accession XM_017177). Accordingly, utilities of VGAM263 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 264 (VGAM264) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7897] VGAM264 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM264 was detected is described hereinabove with reference to Figs. 1–8.

[7898] VGAM264 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7899] VGAM264 gene encodes a VGAM264 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM264 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM264 precursor RNA is designated SEQ ID:250, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:250 is located at position 148297 relative to the genome of Vaccinia Virus.

[7900] VGAM264 precursor RNA folds onto itself, forming VGAM264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM264 folded precursor RNA into VGAM264 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM264 RNA is designated SEQ ID:599, and is provided hereinbelow with reference to the sequence listing part.

[7902] VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM264 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM264 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7903] VGAM264 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM264 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM264 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7904] The complementary binding of VGAM264 RNA, herein designated VGAM RNA, to host target binding sites on VGAM264 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM264 host target RNA into VGAM264 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7905] It is appreciated that VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM264 host target genes. The mRNA of each one of this plurality of VGAM264 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM264 RNA, herein designated VGAM RNA, and which when bound by VGAM264 RNA causes inhibition of translation of respective one or more VGAM264 host target proteins.

[7906] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM264 gene, herein designated VGAM GENE, on one or more VGAM264 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7907] It is yet further appreciated that a function of VGAM264 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM264 correlate with, and may be deduced from, the identity of the host

target genes which VGAM264 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7908] Nucleotide sequences of the VGAM264 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM264 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM264 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM264 are further described hereinbelow with reference to Table 1.

[7909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM264 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM264 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM264 gene, herein designated VGAM is inhibition of expression of VGAM264 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM264 correlate with, and may be deduced from, the identity of the target genes which VGAM264

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7911] Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231) is a VGAM264 host target gene. FLRT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLRT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLRT2 BINDING SITE, designated SEQ ID:1437, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:599.

[7912] A function of VGAM264 is therefore inhibition of Fibronectin Leucine Rich Transmembrane Protein 2 (FLRT2, Accession NM_013231), a gene which may have a function in cell adhesion and/or receptor signaling. Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLRT2. The function of FLRT2 has been established by previous studies. The FLRT family of proteins structurally resembles small leucine-rich proteoglycans found in the extracellular matrix. By screening human brain cD-

NAs for the potential to encode proteins that are at least 50 kD, Ishikawa et al. (1997) isolated a FLRT2 cDNA, which they called KIAA0405. The deduced 660–amino acid full–length FLRT2 protein shares 25% amino acid sequence identity with the precursor of the alpha chain of human platelet glycoprotein Ib (GP1BA; OMIM Ref. No. 231200) across 180 residues. By SDS–PAGE, in vitro transcribed/translated FLRT2 had an apparent molecular mass of approximately 75 kD. RT–PCR detected FLRT2 expression in a number of human tissues, with highest expression in ovary and relatively high expression in brain and pancreas. By searching a human EST database with portions of the FLRT1 protein (OMIM Ref. No. 604806) sequence, Lacy et al. (1999) identified ESTs encoding FLRT2. The full–length FLRT2 coding sequence encodes a predicted 660–amino acid protein containing a putative N–terminal signal sequence, 10 leucine–rich repeats (LRRs) flanked by N– and C–terminal cysteine–rich regions, a fibronectin–/collagen–like domain, a transmembrane domain, and an intracellular C–terminal tail. FLRT2 has 5 potential N–glycosylation sites in its extracellular region. FLRT2 shares 44% amino acid sequence identity with FLRT3 (OMIM Ref. No. 604808) and 41% identity with

FLRT1. Recombinant FLRT2 expressed in SF9 insect cells and monkey COS-1 cells migrated as an 85-kD protein on SDS-polyacrylamide gels. The authors demonstrated that FLRT2 is glycosylated. Northern blot analysis of a variety of human adult tissues detected a 7.5-kb FLRT2 transcript that was expressed abundantly in pancreas and less abundantly in skeletal muscle, brain, and heart. Lacy et al. (1999) suggested that FLRT2 functions in cell adhesion and/or receptor signaling. By analysis of a radiation hybrid mapping panel, Ishikawa et al. (1997) mapped the FLRT2 gene to chromosome 14. Lacy et al. (1999) noted that a UniGene cluster corresponding to the FLRT2 gene has been mapped to 14q24-q32.

[7913] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7914] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. VIII. 78 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 4: 307-313, 1997. ; and

: Identification of FLRT1, FLRT2, and FLRT3: a novel family of transmembrane leucine-rich repeat proteins. Genomics 62: 417-4.

[7916] Further studies establishing the function and utilities of FLRT2 are found in John Hopkins OMIM database record ID 604807, and in cited publications numbered 25 and 968 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KDEL (Lys-Asp-Glu-Leu) Endoplasmic Reticulum Protein Retention Receptor 2 (KDEL2, Accession NM_006854) is another VGAM264 host target gene. KDEL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KDEL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KDEL2 BINDING SITE, designated SEQ ID:1335, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:599.

[7917] Another function of VGAM264 is therefore inhibition of KDEL (Lys-Asp-Glu-Leu) Endoplasmic Reticulum Protein Retention Receptor 2 (KDEL2, Accession NM_006854). Accordingly, utilities of VGAM264 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with KDELR2. SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM_006937) is another VGAM264 host target gene. SMT3H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMT3H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H2 BINDING SITE, designated SEQ ID:1341, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:599.

[7918] Another function of VGAM264 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 2 (yeast) (SMT3H2, Accession NM_006937). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H2. LOC158997 (Accession XM_088736) is another VGAM264 host target gene. LOC158997 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158997, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC158997 BINDING SITE, designated SEQ ID:3230, to the nucleotide sequence of VGAM264 RNA, herein designated VGAM RNA, also designated SEQ ID:599.

[7919] Another function of VGAM264 is therefore inhibition of LOC158997 (Accession XM_088736). Accordingly, utilities of VGAM264 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158997. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 265 (VGAM265) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7920] VGAM265 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM265 was detected is described hereinabove with reference to Figs. 1–8.

[7921] VGAM265 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[7922] VGAM265 gene encodes a VGAM265 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM265 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM265 precursor RNA is designated SEQ ID:251, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:251 is located at position 148003 relative to the genome of Vaccinia Virus.

[7923] VGAM265 precursor RNA folds onto itself, forming VGAM265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7924] An enzyme complex designated DICER COMPLEX, `dices` the VGAM265 folded precursor RNA into VGAM265 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM265 RNA is designated SEQ ID:600, and is provided hereinbelow with reference to the sequence listing part.

[7925] VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM265 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7926] VGAM265 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM265 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM265 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7927] The complementary binding of VGAM265 RNA, herein designated VGAM RNA, to host target binding sites on VGAM265 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM265 host target RNA into VGAM265 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7928] It is appreciated that VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM265 host target genes. The mRNA of each one of this plurality of VGAM265 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM265 RNA, herein designated VGAM RNA, and which when bound by VGAM265 RNA causes inhibition of translation of respective one or more VGAM265 host target proteins.

[7929] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM265 gene, herein designated VGAM GENE, on one or more VGAM265 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7930] It is yet further appreciated that a function of VGAM265 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM265 correlate with, and may be deduced from, the identity of the host target genes which VGAM265 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7931] Nucleotide sequences of the VGAM265 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM265 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM265 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM265 are further described hereinbelow with reference to Table 1.

[7932] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM265 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM265 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7933] As mentioned hereinabove with reference to Fig. 1, a function of VGAM265 gene, herein designated VGAM is inhibition of expression of VGAM265 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM265 correlate with, and may be deduced from, the identity of the target genes which VGAM265 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7934] Apolipoprotein C-IV (APOC4, Accession NM_001646) is a VGAM265 host target gene. APOC4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APOC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APOC4 BINDING SITE, designated SEQ ID:841, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:600.

[7935] A function of VGAM265 is therefore inhibition of Apolipoprotein C-IV (APOC4, Accession NM_001646). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APOC4. DKFZP434P0721 (Accession XM_033181) is another VGAM265 host target gene. DKFZP434P0721 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P0721, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P0721 BINDING SITE, designated SEQ ID:2664, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:600.

[7936] Another function of VGAM265 is therefore inhibition of DKFZP434P0721 (Accession XM_033181). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P0721. FLJ14082 (Accession NM_025024) is another VGAM265 host target gene. FLJ14082 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14082, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14082 BINDING SITE, designated SEQ ID:2129, to the nucleotide sequence of VGAM265 RNA, herein designated VGAM RNA, also designated SEQ ID:600.

[7937] Another function of VGAM265 is therefore inhibition of FLJ14082 (Accession NM_025024). Accordingly, utilities of VGAM265 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14082. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 266 (VGAM266) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7938] VGAM266 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM266 was detected is described hereinabove with reference to Figs. 1–8.

[7939] VGAM266 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM266 host target gene, herein designated VGAM

HOST TARGET GENE, is a human gene contained in the human genome.

[7940] VGAM266 gene encodes a VGAM266 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM266 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM266 precursor RNA is designated SEQ ID:252, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:252 is located at position 149215 relative to the genome of Vaccinia Virus.

[7941] VGAM266 precursor RNA folds onto itself, forming VGAM266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7942] An enzyme complex designated DICER COMPLEX, `dices` the VGAM266 folded precursor RNA into VGAM266 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM266 RNA is designated SEQ ID:601, and is provided hereinbelow with reference to the sequence listing part.

[7943] VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM266 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7944] VGAM266 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM266 RNA is an accurate or a

partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM266 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7945] The complementary binding of VGAM266 RNA, herein designated VGAM RNA, to host target binding sites on VGAM266 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM266 host target RNA into VGAM266 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[7946] It is appreciated that VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM266 host target genes. The mRNA of each one of this plurality of VGAM266 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM266 RNA, herein designated VGAM RNA, and which when bound by VGAM266 RNA causes inhibition of translation of respective one or more VGAM266 host target proteins.

[7947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM266 gene, herein designated VGAM GENE, on one or more VGAM266 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate ex-

pression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7948] It is yet further appreciated that a function of VGAM266 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM266 correlate with, and may be deduced from, the identity of the host target genes which VGAM266 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7949] Nucleotide sequences of the VGAM266 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM266 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM266 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM266 are further described hereinbelow with reference to Table 1.

[7950] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM266 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM266 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7951] As mentioned hereinabove with reference to Fig. 1, a function of VGAM266 gene, herein designated VGAM is inhibition of expression of VGAM266 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM266 correlate with, and may be deduced from, the identity of the target genes which VGAM266 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7952] LIM Domain Only 7 (LMO7, Accession NM_005358) is a VGAM266 host target gene. LMO7 BINDING SITE1 and LMO7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LMO7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LMO7 BINDING SITE1 and LMO7 BINDING SITE2, designated SEQ ID:1202 and SEQ ID:1643 respec-

tively, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7953] A function of VGAM266 is therefore inhibition of LIM Domain Only 7 (LMO7, Accession NM_005358). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LMO7. KIAA1671 (Accession XM_037809) is another VGAM266 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:2726, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7954] Another function of VGAM266 is therefore inhibition of KIAA1671 (Accession XM_037809). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM)

and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM_003966) is another VGAM266 host target gene. SEMA5A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA5A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA5A BINDING SITE, designated SEQ ID:1075, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7955] Another function of VGAM266 is therefore inhibition of Sema Domain, Seven Thrombospondin Repeats (type 1 and type 1-like), Transmembrane Domain (TM) and Short Cytoplasmic Domain, (semaphorin) 5A (SEMA5A, Accession NM_003966). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA5A. LOC127133 (Accession XM_059114) is another VGAM266 host target gene. LOC127133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127133 BINDING SITE, designated SEQ ID:3004, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7956] Another function of VGAM266 is therefore inhibition of LOC127133 (Accession XM_059114). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127133. LOC143154 (Accession XM_084441) is another VGAM266 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:3052, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7957] Another function of VGAM266 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143154. LOC219294 (Accession XM_167566) is another VGAM266 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:3587, to the nucleotide sequence of VGAM266 RNA, herein designated VGAM RNA, also designated SEQ ID:601.

[7958] Another function of VGAM266 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM266 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 267 (VGAM267) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7959] VGAM267 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM267 was detected is described hereinabove with reference to Figs. 1–8.

[7960] VGAM267 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7961] VGAM267 gene encodes a VGAM267 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM267 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM267 precursor RNA is designated SEQ ID:253, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:253 is located at position 148793 relative to the genome of Vaccinia Virus.

[7962] VGAM267 precursor RNA folds onto itself, forming VGAM267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7963] An enzyme complex designated DICER COMPLEX, `dices` the VGAM267 folded precursor RNA into VGAM267 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM267 RNA is designated SEQ ID:602, and is provided hereinbelow with reference to the sequence listing part.

[7964] VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM267 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7965] VGAM267 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM267 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM267 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7966] The complementary binding of VGAM267 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM267 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM267 host target RNA into VGAM267 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7967] It is appreciated that VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM267 host target genes. The mRNA of each one of this plurality of VGAM267 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM267 RNA, herein designated VGAM RNA, and which when bound by VGAM267 RNA causes inhibition of translation of respective one or more VGAM267 host target proteins.

[7968] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM267 gene, herein designated VGAM GENE, on one or more VGAM267 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7969] It is yet further appreciated that a function of VGAM267 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM267 correlate with, and may be deduced from, the identity of the host target genes which VGAM267 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7970] Nucleotide sequences of the VGAM267 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM267 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM267 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM267 are further described hereinbelow with reference to Table 1.

[7971] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM267 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM267 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7972] As mentioned hereinabove with reference to Fig. 1, a function of VGAM267 gene, herein designated VGAM is inhibition of expression of VGAM267 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM267 correlate with, and may be deduced from, the identity of the target genes which VGAM267 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7973] Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512) is a VGAM267 host target gene. GARP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GARP, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARP BINDING SITE, designated SEQ ID:1221, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:602.

[7974] A function of VGAM267 is therefore inhibition of Glycoprotein A Repetitions Predominant (GARP, Accession NM_005512). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARP. FLJ30213 (Accession NM_145008) is another VGAM267 host target gene. FLJ30213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30213 BINDING SITE, designated SEQ ID:2507, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:602.

[7975] Another function of VGAM267 is therefore inhibition of FLJ30213 (Accession NM_145008). Accordingly, utilities of

VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30213. LOC196510 (Accession XM_113738) is another VGAM267 host target gene. LOC196510 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196510, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196510 BINDING SITE, designated SEQ ID:3415, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:602.

[7976] Another function of VGAM267 is therefore inhibition of LOC196510 (Accession XM_113738). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196510. LOC200220 (Accession XM_114157) is another VGAM267 host target gene. LOC200220 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200220 BINDING SITE, designated SEQ ID:3444, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:602.

[7977] Another function of VGAM267 is therefore inhibition of LOC200220 (Accession XM_114157). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200220. LOC220930 (Accession XM_167624) is another VGAM267 host target gene. LOC220930 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220930, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220930 BINDING SITE, designated SEQ ID:3591, to the nucleotide sequence of VGAM267 RNA, herein designated VGAM RNA, also designated SEQ ID:602.

[7978] Another function of VGAM267 is therefore inhibition of LOC220930 (Accession XM_167624). Accordingly, utilities of VGAM267 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220930. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 268 (VGAM268) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7979] VGAM268 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM268 was detected is described hereinabove with reference to Figs. 1–8.

[7980] VGAM268 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7981] VGAM268 gene encodes a VGAM268 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM268 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM268 precursor RNA is designated SEQ ID:254, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:254 is located at position 153199 relative to the genome of Vac–

cinia Virus.

[7982] VGAM268 precursor RNA folds onto itself, forming VGAM268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7983] An enzyme complex designated DICER COMPLEX, `dices` the VGAM268 folded precursor RNA into VGAM268 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide sequence of VGAM268 RNA is designated SEQ ID:603, and is provided hereinbelow with reference to the sequence listing part.

[7984] VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM268 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7985] VGAM268 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM268 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM268 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[7986] The complementary binding of VGAM268 RNA, herein designated VGAM RNA, to host target binding sites on VGAM268 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM268 host target RNA into VGAM268 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7987] It is appreciated that VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM268 host target genes. The mRNA of each one of this plurality of VGAM268 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM268 RNA, herein designated VGAM RNA, and which when bound by VGAM268 RNA causes inhibition of translation of respective one or more VGAM268 host target proteins.

[7988] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM268 gene, herein designated VGAM GENE, on one or more VGAM268 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7989] It is yet further appreciated that a function of VGAM268 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM268 correlate

with, and may be deduced from, the identity of the host target genes which VGAM268 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7990] Nucleotide sequences of the VGAM268 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM268 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM268 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM268 are further described hereinbelow with reference to Table 1.

[7991] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM268 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM268 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7992] As mentioned hereinabove with reference to Fig. 1, a function of VGAM268 gene, herein designated VGAM is inhibition of expression of VGAM268 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM268 correlate with, and may be deduced

from, the identity of the target genes which VGAM268 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7993] Zinc Finger Protein 161 (ZNF161, Accession NM_007146) is a VGAM268 host target gene. ZNF161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF161 BINDING SITE, designated SEQ ID:1359, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:603.

[7994] A function of VGAM268 is therefore inhibition of Zinc Finger Protein 161 (ZNF161, Accession NM_007146). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF161. DKFZP566D193 (Accession XM_098173) is another VGAM268 host target gene. DKFZP566D193 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566D193, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566D193 BINDING SITE, designated SEQ ID:3353, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:603.

[7995] Another function of VGAM268 is therefore inhibition of DKFZP566D193 (Accession XM_098173). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566D193. LOC200574 (Accession XM_114264) is another VGAM268 host target gene. LOC200574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200574 BINDING SITE, designated SEQ ID:3450, to the nucleotide sequence of VGAM268 RNA, herein designated VGAM RNA, also designated SEQ ID:603.

[7996] Another function of VGAM268 is therefore inhibition of LOC200574 (Accession XM_114264). Accordingly, utilities of VGAM268 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC200574. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 269 (VGAM269) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7997] VGAM269 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM269 was detected is described hereinabove with reference to Figs. 1–8.

[7998] VGAM269 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7999] VGAM269 gene encodes a VGAM269 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM269 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM269 precursor RNA is designated SEQ ID:255, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:255 is located at position 153361 relative to the genome of Vaccinia Virus.

[8000] VGAM269 precursor RNA folds onto itself, forming VGAM269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8001] An enzyme complex designated DICER COMPLEX, `dices` the VGAM269 folded precursor RNA into VGAM269 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM269 RNA is designated SEQ ID:604, and is provided hereinbelow with reference to the sequence listing part.

[8002] VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM269 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8003] VGAM269 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM269 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM269 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8004] The complementary binding of VGAM269 RNA, herein designated VGAM RNA, to host target binding sites on VGAM269 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM269 host target RNA into VGAM269 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8005] It is appreciated that VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM269 host target genes. The mRNA of each one of this plurality of VGAM269 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM269 RNA, herein designated VGAM RNA, and which when bound by VGAM269 RNA causes in-

hibition of translation of respective one or more VGAM269 host target proteins.

[8006] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM269 gene, herein designated VGAM GENE, on one or more VGAM269 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8007] It is yet further appreciated that a function of VGAM269 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM269 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM269 correlate with, and may be deduced from, the identity of the host target genes which VGAM269 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8008] Nucleotide sequences of the VGAM269 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM269 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM269 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM269 are further described hereinbelow with reference to Table 1.

[8009] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM269 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM269 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8010] As mentioned hereinabove with reference to Fig. 1, a function of VGAM269 gene, herein designated VGAM is inhibition of expression of VGAM269 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM269 correlate with, and may be deduced from, the identity of the target genes which VGAM269 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8011] RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732) is a VGAM269 host target gene. RAD50 BINDING SITE1 and RAD50 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by RAD50, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAD50 BINDING SITE1 and RAD50 BINDING SITE2, designated SEQ ID:1240 and SEQ ID:2420 respectively, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:604.

[8012] A function of VGAM269 is therefore inhibition of RAD50 Homolog (*S. cerevisiae*) (RAD50, Accession NM_005732), a gene which is involved in dna double-strand break repair (dsbr). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAD50. The function of RAD50

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Tripartite Motif-containing 9 (TRIM9, Accession NM_015163) is another VGAM269 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:1611, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:604.

[8013] Another function of VGAM269 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked oligosaccharides. Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 and its association with various diseases and clinical condi-

tions, has been established by previous studies, as described hereinabove with reference to VGAM101.FLJ13902 (Accession NM_024653) is another VGAM269 host target gene. FLJ13902 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ13902, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13902 BINDING SITE, designated SEQ ID:2076, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:604.

[8014] Another function of VGAM269 is therefore inhibition of FLJ13902 (Accession NM_024653). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13902. KIAA0650 (Accession XM_113962) is another VGAM269 host target gene. KIAA0650 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0650 BINDING SITE,

designated SEQ ID:3427, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:604.

[8015] Another function of VGAM269 is therefore inhibition of KIAA0650 (Accession XM_113962). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0650. MGC16075 (Accession NM_032761) is another VGAM269 host target gene. MGC16075 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16075, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16075 BINDING SITE, designated SEQ ID:2277, to the nucleotide sequence of VGAM269 RNA, herein designated VGAM RNA, also designated SEQ ID:604.

[8016] Another function of VGAM269 is therefore inhibition of MGC16075 (Accession NM_032761). Accordingly, utilities of VGAM269 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16075. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 270 (VGAM270) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8017] VGAM270 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM270 was detected is described hereinabove with reference to Figs. 1–8.

[8018] VGAM270 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8019] VGAM270 gene encodes a VGAM270 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM270 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM270 precursor RNA is designated SEQ ID:256, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:256 is located at position 153717 relative to the genome of Vac–

cinia Virus.

[8020] VGAM270 precursor RNA folds onto itself, forming VGAM270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8021] An enzyme complex designated DICER COMPLEX, `dices` the VGAM270 folded precursor RNA into VGAM270 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM270 RNA is designated SEQ ID:605, and is provided hereinbelow with reference to the sequence listing part.

[8022] VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM270 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8023] VGAM270 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM270 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM270 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8024] The complementary binding of VGAM270 RNA, herein designated VGAM RNA, to host target binding sites on VGAM270 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM270 host target RNA into VGAM270 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8025] It is appreciated that VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM270 host target genes. The mRNA of each one of this plurality of VGAM270 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM270 RNA, herein designated VGAM RNA, and which when bound by VGAM270 RNA causes inhibition of translation of respective one or more VGAM270 host target proteins.

[8026] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM270 gene, herein designated VGAM GENE, on one or more VGAM270 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8027] It is yet further appreciated that a function of VGAM270 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM270 correlate

with, and may be deduced from, the identity of the host target genes which VGAM270 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8028] Nucleotide sequences of the VGAM270 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM270 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM270 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM270 are further described hereinbelow with reference to Table 1.

[8029] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM270 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM270 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8030] As mentioned hereinabove with reference to Fig. 1, a function of VGAM270 gene, herein designated VGAM is inhibition of expression of VGAM270 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM270 correlate with, and may be deduced

from, the identity of the target genes which VGAM270 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8031] PAIP2 (Accession NM_016480) is a VGAM270 host target gene. PAIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAIP2 BINDING SITE, designated SEQ ID:1687, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:605.

[8032] A function of VGAM270 is therefore inhibition of PAIP2 (Accession NM_016480). Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAIP2. Protein (peptidyl-prolyl cis/trans isomerase) NIMA-interacting, 4 (parvulin) (PIN4, Accession NM_006223) is another VGAM270 host target gene. PIN4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIN4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of PIN4 BINDING SITE, designated SEQ ID:1282, to the nucleotide sequence of VGAM270 RNA, herein designated VGAM RNA, also designated SEQ ID:605.

[8033] Another function of VGAM270 is therefore inhibition of Protein (peptidyl–prolyl cis/trans isomerase) NIMA–interacting, 4 (parvulin) (PIN4, Accession NM_006223), a gene which is a peptidyl–prolyl cis/trans isomerases. Accordingly, utilities of VGAM270 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIN4. The function of PIN4 has been established by previous studies. By searching an EST database using human PIN1 and E. coli parvulin sequences as probes, followed by screening a lung cDNA library, Uchida et al. (1999) isolated a cDNA encoding PIN4, which they called PAR14 (parvulin–14). Using a similar method, Rulten et al. (1999) isolated a cDNA encoding PIN4, which they called EPVH (eukaryotic parvulin homolog). Sequence analysis predicted that the 131–amino acid PIN4 protein contains a PPlase domain preceded by a 40–amino acid glycine– and lysine–rich N–terminal sequence. PIN4, however, lacks a WW domain, a nuclear localization motif, and residues required for phosphoprotein interactions. Multi–

ple-tissue Northern blot analysis detected variable expression of an approximately 1.0-kb PIN4 transcript in all tissues tested, with notably lower expression in neuronal tissue. Transmission electron microscopy demonstrated preferential localization of PIN4 in the mitochondrial matrix. Functional analysis failed to show PPlase activity, possibly due to proteolytic degradation or different substrate requirements.

[8034] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8035] Rulten, S.; Thorpe, J.; Kay, J. : Identification of eukaryotic parvulin homologues: a new subfamily of peptidylprolyl cis-trans isomerases. *Biochem. Biophys. Res. Commun.* 259: 557-562, 1999. ; and

[8036] Uchida, T.; Fujimori, F.; Tradler, T.; Fischer, G.; Rahfeld, J.-U. : Identification and characterization of a 14 kDa human protein as a novel parvulin-like peptidyl prolyl cis/trans is.

[8037] Further studies establishing the function and utilities of PIN4 are found in John Hopkins OMIM database record ID 300252, and in cited publications numbered 1963 listed in the bibliography section hereinbelow, which are also

hereby incorporated by reference. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 271 (VGAM271) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8038] VGAM271 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM271 was detected is described hereinabove with reference to Figs. 1–8.

[8039] VGAM271 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8040] VGAM271 gene encodes a VGAM271 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM271 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM271 precursor RNA is designated SEQ ID:257, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:257 is located at position 152876 relative to the genome of Vaccinia Virus.

[8041] VGAM271 precursor RNA folds onto itself, forming VGAM271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8042] An enzyme complex designated DICER COMPLEX, `dices` the VGAM271 folded precursor RNA into VGAM271 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM271 RNA is designated SEQ ID:606, and is provided hereinbelow with reference to the sequence listing part.

[8043] VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM271 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8044] VGAM271 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM271 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM271 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8045] The complementary binding of VGAM271 RNA, herein designated VGAM RNA, to host target binding sites on VGAM271 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM271 host target RNA into VGAM271 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8046] It is appreciated that VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM271 host target genes. The mRNA of each one of this plurality of VGAM271 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM271 RNA, herein designated VGAM RNA, and which when bound by VGAM271 RNA causes in-

hibition of translation of respective one or more VGAM271 host target proteins.

[8047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM271 gene, herein designated VGAM GENE, on one or more VGAM271 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8048] It is yet further appreciated that a function of VGAM271 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM271 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM271 correlate with, and may be deduced from, the identity of the host target genes which VGAM271 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8049] Nucleotide sequences of the VGAM271 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM271 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM271 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM271 are further described hereinbelow with reference to Table 1.

[8050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM271 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM271 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8051] As mentioned hereinabove with reference to Fig. 1, a function of VGAM271 gene, herein designated VGAM is inhibition of expression of VGAM271 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM271 correlate with, and may be deduced from, the identity of the target genes which VGAM271 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8052] HLA-G Histocompatibility Antigen, Class I, G (HLA-G, Accession NM_002127) is a VGAM271 host target gene. HLA-G BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HLA-G, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HLA-G BINDING SITE, designated SEQ ID:900, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8053] A function of VGAM271 is therefore inhibition of HLA-G Histocompatibility Antigen, Class I, G (HLA-G, Accession NM_002127), a gene which involved in the presentation of foreign antigens to the immune system. Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HLA-G. The function of HLA-G has been established by previous studies. Extravillous trophoblast from normal

human placenta and the BeWo adherent human choriocarcinoma cell line express an unusual form of class I HLA molecule. This molecule has an H chain of approximately 40 kD and is apparently nonpolymorphic. Ellis et al. (1990) isolated and sequenced a cDNA clone for this class I HLA antigen. The nucleotide sequence showed a high degree of homology with the published sequence of a genomic clone, HLA 6.0, which is the product of a class I locus other than A, B, or C. The new locus was provisionally designated HLAG. Using PCR, Ellis et al. (1990) demonstrated similar HLA class I sequences in cDNA from normal extravillous trophoblasts. Although there was some nucleotide sequence polymorphism, the amino acid sequence of the molecule was conserved; hence, it is unlikely to provoke immune responses even though it is found at the fetal-maternal interface. Considering the well established role of nonclassic HLA-G class I molecules in inhibiting natural killer cell function, the consequence of abnormal HLA-G expression in malignant cells should be the escape of tumors from immunosurveillance. To examine this hypothesis, Paul et al. (1998) analyzed HLA-G expression and NK sensitivity in human malignant melanoma cells. Two melanoma cell lines exhibited a high

level of HLA-G transcription with differential HLA-G isoform transcription and protein expression patterns. A higher level of HLA-G transcription ex vivo was detected in a skin melanoma metastasis biopsy compared with a healthy skin fragment from the same individual. HLA-G protein isoforms other than membrane-bound HLA-G1 protected 1 melanoma cell line from NK lysis. It thus appeared of critical importance to consider the specific role of HLA-G expression in tumors in the design of cancer immunotherapies.

[8054] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8055] Ellis, S. A.; Palmer, M. S.; McMichael, A. J. : Human trophoblast and the choriocarcinoma cell line BeWo express a truncated HLA class I molecule. *J. Immun.* 144: 731-735, 1990. ; and

[8056] Paul, P.; Rouas-Freiss, N.; Khalil-Daher, I.; Moreau, P.; Riteau, B.; Le Gal, F. A.; Avril, M. F.; Dausset, J.; Guillet, J. G.; Carosella, E. D. : HLA-G expression in melanoma: a way fo.

[8057] Further studies establishing the function and utilities of HLA-G are found in John Hopkins OMIM database record

ID 142871, and in cited publications numbered 758, 2647–2656, 881, 2657–265 and 2662–2664 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Histamine Receptor H2 (HRH2, Accession NM_022304) is another VGAM271 host target gene. HRH2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by HRH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH2 BINDING SITE, designated SEQ ID:1984, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8058] Another function of VGAM271 is therefore inhibition of Histamine Receptor H2 (HRH2, Accession NM_022304), a gene which stimulates cAMP production and promotes a Th2 immune response. Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH2. The function of HRH2 has been established by previous studies. Members of the DEAD box protein family are putative ATP-dependent RNA helicases that have been implicated in pre-mRNA splicing and diverse other cellular functions.

See RNA helicase 1 (HRH1; 600396). One subfamily of the DEAD box family, the DEAH box proteins, appear to be somewhat specific to mRNA splicing. Several *S. cerevisiae* PRP (pre-mRNA processing) genes encode DEAH proteins. By RT-PCR of HeLa cell mRNA with degenerate primers based on conserved regions of DEAH box proteins, Ono et al. (1994) isolated partial cDNAs encoding 5 members of the human DEAH box family, including HRH1 and HRH2. They determined that HRH2 shares 61% amino acid sequence identity with *S. cerevisiae* JA1. Imamura et al. (1997) isolated cDNAs corresponding to the entire coding region of HRH2, which they called DBP1 (DEAH box protein 1). The predicted 813-amino acid protein contains 7 consecutive motifs characteristic of ATP-dependent RNA helicases, as well as consensus sequences for structural motifs of a DNA/RNA helicase with a DEAH box. Northern blot analysis revealed that DBP1 was expressed as a 3.4-kb mRNA in all tissues tested. An additional larger transcript was observed in many tissues. Gee et al. (1997) isolated cDNAs encoding the mouse HRH2 homolog, mDEAH9. Gee et al. (1997) reported that mDEAH9 and Prp43 are 65% identical over a 500-amino acid region spanning the central helicase domain and C-terminal re-

gion, and that mDEAH9 and HRH2 were 98% identical in the helicase domain. When expressed in yeast, mDEAH9 complemented the Prp43 mutation specifically, although with less efficiency than the native yeast protein. Immunofluorescence experiments showed that mDEAH9 colocalizes with splicing factor SC35 (OMIM Ref. No. 600813) in punctate nuclear speckles in mammalian cells, consistent with its predicted role as a pre-mRNA splicing factor. Gee et al. (1997) suggested that mDEAH9 represents a mammalian homolog of Prp43.

[8059] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8060] Imamura, O.; Sugawara, M.; Furuichi, Y. : Cloning and characterization of a putative human RNA helicase gene of the DEAH-box protein family. *Biochem. Biophys. Res. Commun.* 240: 335–340, 1997. ; and

[8061] Ono, Y.; Ohno, M.; Shimura, Y. : Identification of a putative RNA helicase (HRH1), a human homolog of yeast Prp22. *Molec. Cell. Biol.* 14: 7611–7620, 1994.

[8062] Further studies establishing the function and utilities of HRH2 are found in John Hopkins OMIM database record ID 603403, and in cited publications numbered 1742–174

and 1624 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Inwardly-rectifying Channel, Subfamily J, Member 15 (KCNJ15, Accession NM_002243) is another VGAM271 host target gene. KCNJ15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNJ15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNJ15 BINDING SITE, designated SEQ ID:916, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8063] Another function of VGAM271 is therefore inhibition of Potassium Inwardly-rectifying Channel, Subfamily J, Member 15 (KCNJ15, Accession NM_002243). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNJ15. Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM_004872) is another VGAM271 host target gene. C1orf8 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C1orf8, corresponding to a HOST TARGET bind-

ing site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf8 BINDING SITE, designated SEQ ID:1161, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8064] Another function of VGAM271 is therefore inhibition of Chromosome 1 Open Reading Frame 8 (C1orf8, Accession NM_004872). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf8. FLJ10738 (Accession NM_018199) is another VGAM271 host target gene. FLJ10738 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10738 BINDING SITE, designated SEQ ID:1798, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8065] Another function of VGAM271 is therefore inhibition of FLJ10738 (Accession NM_018199). Accordingly, utilities of

VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10738. FLJ23511 (Accession NM_032239) is another VGAM271 host target gene. FLJ23511 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23511, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23511 BINDING SITE, designated SEQ ID:2239, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8066] Another function of VGAM271 is therefore inhibition of FLJ23511 (Accession NM_032239). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23511. GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612) is another VGAM271 host target gene. GAB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

GAB3 BINDING SITE, designated SEQ ID:2377, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8067] Another function of VGAM271 is therefore inhibition of GRB2-associated Binding Protein 3 (GAB3, Accession NM_080612). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB3. Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM_014216) is another VGAM271 host target gene. ITPK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPK1 BINDING SITE, designated SEQ ID:1484, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8068] Another function of VGAM271 is therefore inhibition of Inositol 1,3,4-triphosphate 5/6 Kinase (ITPK1, Accession NM_014216). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPK1. TRIP-Br2 (Accession

NM_014755) is another VGAM271 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:1539, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8069] Another function of VGAM271 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC152313 (Accession XM_098190) is another VGAM271 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:3355, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also

designated SEQ ID:606.

[8070] Another function of VGAM271 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC256642 (Accession XM_172797) is another VGAM271 host target gene. LOC256642 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256642, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256642 BINDING SITE, designated SEQ ID:3701, to the nucleotide sequence of VGAM271 RNA, herein designated VGAM RNA, also designated SEQ ID:606.

[8071] Another function of VGAM271 is therefore inhibition of LOC256642 (Accession XM_172797). Accordingly, utilities of VGAM271 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256642. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 272 (VGAM272) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8072] VGAM272 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM272 was detected is described hereinabove with reference to Figs. 1–8.

[8073] VGAM272 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8074] VGAM272 gene encodes a VGAM272 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM272 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM272 precursor RNA is designated SEQ ID:258, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:258 is located at position 154919 relative to the genome of Vaccinia Virus.

[8075] VGAM272 precursor RNA folds onto itself, forming

VGAM272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8076] An enzyme complex designated DICER COMPLEX, `dices` the VGAM272 folded precursor RNA into VGAM272 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM272 RNA is designated SEQ ID:607, and is provided hereinbelow with reference to the sequence listing part.

[8077] VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM272 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8078] VGAM272 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM272 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM272 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8079] The complementary binding of VGAM272 RNA, herein designated VGAM RNA, to host target binding sites on VGAM272 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM272 host target RNA into VGAM272 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8080] It is appreciated that VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM272 host target genes. The mRNA of each one of this plurality of VGAM272 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM272 RNA, herein designated VGAM RNA, and which when bound by VGAM272 RNA causes inhibition of translation of respective one or more VGAM272 host target proteins.

[8081] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM272 gene, herein designated VGAM GENE, on one or more VGAM272 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8082] It is yet further appreciated that a function of VGAM272 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM272 correlate with, and may be deduced from, the identity of the host target genes which VGAM272 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[8083] Nucleotide sequences of the VGAM272 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM272 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM272 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM272 are further described hereinbelow with reference to Table 1.

[8084] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM272 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM272 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8085] As mentioned hereinabove with reference to Fig. 1, a function of VGAM272 gene, herein designated VGAM is inhibition of expression of VGAM272 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM272 correlate with, and may be deduced from, the identity of the target genes which VGAM272 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[8086] Chromosome 22 Open Reading Frame 2 (C22orf2, Accession XM_170492) is a VGAM272 host target gene. C22orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C22orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf2 BINDING SITE, designated SEQ ID:3655, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:607.

[8087] A function of VGAM272 is therefore inhibition of Chromosome 22 Open Reading Frame 2 (C22orf2, Accession XM_170492). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf2. LOC153277 (Accession XM_098346) is another VGAM272 host target gene. LOC153277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:3369, to the nucleotide sequence of VGAM272 RNA, herein designated VGAM RNA, also designated SEQ ID:607.

[8088] Another function of VGAM272 is therefore inhibition of LOC153277 (Accession XM_098346). Accordingly, utilities of VGAM272 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153277. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 273 (VGAM273) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8089] VGAM273 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM273 was detected is described hereinabove with reference to Figs. 1–8.

[8090] VGAM273 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[8091] VGAM273 gene encodes a VGAM273 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM273 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM273 precursor RNA is designated SEQ ID:259, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:259 is located at position 154466 relative to the genome of Vaccinia Virus.

[8092] VGAM273 precursor RNA folds onto itself, forming VGAM273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8093] An enzyme complex designated DICER COMPLEX, `dices` the VGAM273 folded precursor RNA into VGAM273 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 91%) nucleotide sequence of VGAM273 RNA is designated SEQ ID:608, and is provided hereinbelow with reference to the sequence listing part.

[8094] VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM273 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8095] VGAM273 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM273 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM273 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8096] The complementary binding of VGAM273 RNA, herein designated VGAM RNA, to host target binding sites on VGAM273 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM273 host target RNA into VGAM273 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8097] It is appreciated that VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM273 host target genes. The mRNA of each one of this plurality of VGAM273 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM273 RNA, herein designated VGAM RNA, and which when bound by VGAM273 RNA causes inhibition of translation of respective one or more VGAM273 host target proteins.

[8098] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM273 gene, herein designated VGAM GENE, on one or more VGAM273 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8099] It is yet further appreciated that a function of VGAM273 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM273 correlate with, and may be deduced from, the identity of the host target genes which VGAM273 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8100] Nucleotide sequences of the VGAM273 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM273 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM273 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM273 are further described hereinbelow with reference to Table 1.

[8101] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM273 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM273 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8102] As mentioned hereinabove with reference to Fig. 1, a function of VGAM273 gene, herein designated VGAM is inhibition of expression of VGAM273 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM273 correlate with, and may be deduced from, the identity of the target genes which VGAM273 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8103] SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521) is a VGAM273 host target gene. SH3BP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP4 BINDING SITE, designated SEQ ID:1506, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8104] A function of VGAM273 is therefore inhibition of SH3-domain Binding Protein 4 (SH3BP4, Accession NM_014521), a gene which is of unknown function, contains SH3-domain binding protein 4; similar to the EH-binding protein. Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3BP4. The function of SH3BP4 has been established by previous studies. A major element of the cornea is a transparent stroma produced and maintained by corneal fibroblasts, or keratocytes. Using differential display of RNA from normal and macular corneal dystrophy cultured keratocytes, followed by screening a corneal fibroblast library, Dunlevy et al. (1999) identified a cDNA encoding SH3BP4. The deduced 963-amino acid SH3BP4 protein contains 3 asn-pro-phe (NPF) motifs, which are EPS15 (OMIM Ref. No. 600051) homology (EH)-binding sites (see OMIM Ref. No. NUMB; 603728); an SH3 domain; a PXXP motif; a bipartite nuclear targeting signal; and a tyrosine phosphorylation site. Sequence analysis predicted that SH3BP4 is identical to a 479-amino acid EH-binding protein (Wong et al., 1995) except for the presence of an additional 73 N-terminal and 411 mid- to C-terminal residues in SH3BP4. Northern

blot analysis revealed ubiquitous expression of a 5.6-kb transcript, with highest levels in pancreas, low levels in kidney, skeletal muscle, and liver, and lowest levels in lung and brain. Expression was also detected in cultured normal keratocytes. Using FISH, Dunlevy et al. (1999) mapped the SH3BP4 gene to 2q37.1–q37.2.

[8105] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8106] Dunlevy, J. R.; Berryhill, B. L.; Vergnes, J.–P.; SundarRaj, N.; Hassell, J. R. : Cloning, chromosomal localization, and characterization of cDNA from a novel gene, SH3BP4, expressed by human corneal fibroblasts. *Genomics* 62: 519–524, 1999. ; and

[8107] Wong, W. T.; Schumacher, C.; Salcini, A. E.; Romano, A.; Castagnino, P.; Pelicci, P. G.; DiFiore, P. P. : A protein-binding domain, EH, identified in the receptor tyrosine kinase substrat.

[8108] Further studies establishing the function and utilities of SH3BP4 are found in John Hopkins OMIM database record ID 605611, and in cited publications numbered 1565–1566 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin

Fusion Degradation 1-like (UFD1L, Accession XM_055490) is another VGAM273 host target gene. UFD1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UFD1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UFD1L BINDING SITE, designated SEQ ID:2973, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8109] Another function of VGAM273 is therefore inhibition of Ubiquitin Fusion Degradation 1-like (UFD1L, Accession XM_055490), a gene which is essential component of the ubiquitin-dependent proteolytic pathway . Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UFD1L. The function of UFD1L has been established by previous studies. In a search for genes in the 22q11.2 region possibly implicated in the DiGeorge syndrome (OMIM Ref. No. 188400), Pizutti et al. (1997) identified a gene whose functional features and tissue-specific expression suggested a distinct role in embryogenesis. Symbolized UFD1L by them (for ubiquitin fusion degradation

1-like), the gene encodes the human homolog of the yeast ubiquitin fusion degradation 1 (UFD1) protein that is involved in the degradation of ubiquitin fusion proteins (see OMIM Ref. No. 191320). Cloning and characterization of the murine homolog (Ufd1l) showed it to be expressed during embryogenesis in the eyes and in the inner ear primordia. These findings suggested to Pizutti et al. (1997) that the proteolytic pathway recognizing ubiquitin fusion proteins for degradation is conserved in vertebrates and that UFD1L gene hemizyosity may be the cause of some of the CATCH22-associated developmental defects. The basic helix-loop-helix transcription factor dHAND (HAND2; 602407) is required for survival of cells in the neural crest-derived branchial and aortic arch arteries and the right ventricle. Mice lacking endothelin-1 (EDN1; 131240) have cardiac and cranial neural crest defects typical of the 22q11 deletion syndrome and display down-regulation of dHAND, suggesting that a molecular pathway involving dHAND may be disrupted in that syndrome. The HAND2, EDN1, and ET1 receptor (EDNRA; 131243) genes do not map to 22q11, the DiGeorge syndrome critical region, in humans. In a screen for mouse genes dependent on dHAND, Yamagishi et al. (1999) identified

Ufd1, which maps to human 22q11 and encodes a protein involved in degradation of ubiquitinated proteins. Mouse Ufd1 was specifically expressed in most tissues affected in patients with the DiGeorge (22q11 deletion) syndrome. Yamagishi et al. (1999) found, furthermore, that the human UFD1L gene was deleted in all 182 patients studied with the 22q11 deletion, and a smaller deletion of approximately 20 kb that removed exons 1 to 3 of UFD1L was found in 1 individual with features typical of 22q11 deletion syndrome. In the individual with the smaller deletion, patient J.F., Yamagishi et al. (1999) found that the CDC45L gene (OMIM Ref. No. 603465), which is immediately telomeric of UFD1L, was the site of the deletion in the region between exons 5 and 6 of the 5-prime breakpoint. They considered that the deletion in CDC45L may act as a modifier of the phenotype in patient J.F. UFD1L and CDC45L are transcribed in opposite directions. The deletion left exons 4 to 12 of UFD1L intact; the first 5 exons of CDC45L were deleted. Patient J.F. had nearly all of the features commonly associated with the 2-Mb 22q11 deletion. Four days after birth the patient was diagnosed with interrupted aortic arch, persistent truncus arteriosus, cleft palate, small mouth, low-set ears, broad nasal

bridge, neonatal hypocalcemia, T-lymphocyte deficiency, and syndactyly of her toes. The deletion was not present in her parents or in 100 control subjects.

[8110] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8111] Pizutti, A.; Novelli, G.; Ratti, A.; Amati, F.; Mari, A.; Calabrese, G.; Nicolis, S.; Silani, V.; Marino, B.; Scarlato, G.; Ottolenghi, S.; Dallapiccola, B. : UFD1L, a developmentally expressed ubiquitination gene, is deleted in CATCH 22 syndrome. Hum. Molec. Genet. 6: 259–265, 1997. ; and

[8112] Yamagishi, H.; Garg, V.; Matsuoka, R.; Thomas, T.; Srivastava, D. : A molecular pathway revealing a genetic basis for human cardiac and craniofacial defects. Science 283: 1158–1161, 199.

[8113] Further studies establishing the function and utilities of UFD1L are found in John Hopkins OMIM database record ID 601754, and in cited publications numbered 1446–1447 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ20081 (Accession NM_017658) is another VGAM273 host target gene. FLJ20081 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by FLJ20081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20081 BINDING SITE, designated SEQ ID:1736, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8114] Another function of VGAM273 is therefore inhibition of FLJ20081 (Accession NM_017658). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20081. KIAA1635 (Accession XM_042203) is another VGAM273 host target gene. KIAA1635 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1635, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1635 BINDING SITE, designated SEQ ID:2804, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8115] Another function of VGAM273 is therefore inhibition of KIAA1635 (Accession XM_042203). Accordingly, utilities

of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1635. PRO1257 (Accession NM_018578) is another VGAM273 host target gene. PRO1257 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1257 BINDING SITE, designated SEQ ID:1848, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8116] Another function of VGAM273 is therefore inhibition of PRO1257 (Accession NM_018578). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1257. LOC153020 (Accession XM_087578) is another VGAM273 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153020 BINDING

SITE, designated SEQ ID:3177, to the nucleotide sequence of VGAM273 RNA, herein designated VGAM RNA, also designated SEQ ID:608.

[8117] Another function of VGAM273 is therefore inhibition of LOC153020 (Accession XM_087578). Accordingly, utilities of VGAM273 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 274 (VGAM274) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8118] VGAM274 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM274 was detected is described hereinabove with reference to Figs. 1–8.

[8119] VGAM274 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8120] VGAM274 gene encodes a VGAM274 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM274 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM274 precursor RNA is designated SEQ ID:260, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:260 is located at position 156944 relative to the genome of Vaccinia Virus.

[8121] VGAM274 precursor RNA folds onto itself, forming VGAM274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8122] An enzyme complex designated DICER COMPLEX, `dices` the VGAM274 folded precursor RNA into VGAM274 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM274 RNA is designated SEQ ID:609, and is provided hereinbelow with reference to the sequence listing part.

[8123] VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM274 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8124] VGAM274 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM274 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM274 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8125] The complementary binding of VGAM274 RNA, herein designated VGAM RNA, to host target binding sites on VGAM274 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM274 host target RNA into VGAM274 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8126] It is appreciated that VGAM274 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM274 host target genes. The mRNA of each one of this plurality of VGAM274 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM274 RNA, herein designated VGAM RNA, and which when bound by VGAM274 RNA causes inhibition of translation of respective one or more VGAM274 host target proteins.

[8127] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM274 gene, herein designated VGAM GENE, on one or more VGAM274 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[8128] It is yet further appreciated that a function of VGAM274 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM274 correlate with, and may be deduced from, the identity of the host target genes which VGAM274 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8129] Nucleotide sequences of the VGAM274 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM274 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM274 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM274 are further described hereinbelow with reference to Table 1.

[8130] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM274 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM274 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8131] As mentioned hereinabove with reference to Fig. 1, a function of VGAM274 gene, herein designated VGAM is inhibition of expression of VGAM274 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM274 correlate with, and may be deduced from, the identity of the target genes which VGAM274 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8132] Basonuclin (BNC, Accession NM_001717) is a VGAM274 host target gene. BNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BNC BINDING SITE, designated SEQ ID:851, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:609.

[8133] A function of VGAM274 is therefore inhibition of Basonu-

clin (BNC, Accession NM_001717), a gene which plays a role in the maintenance of proliferative capacity and prevention of terminal differentiation of keratinocytes. Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNC. The function of BNC has been established by previous studies. Basonuclin (BNC) is a protein found mainly in cells of the basal layer of stratified squamous epithelia. Tseng and Green (1992) isolated a cDNA encoding this protein from mRNA of cultural human keratinocytes. The basonuclin cDNA encodes a 993-amino acid polypeptide that is located in the nucleus and contains 6 zinc finger motifs of the C2H2 class, as in known transcription factors. Basonuclin is expressed in cells that are able to undergo division but are not necessarily in the division cycle; the protein is not found in terminally differentiated cells (Tseng and Green, 1994). These properties suggested that basonuclin performs a transcriptional regulatory function related to promotion of keratinocyte growth or suppression of keratinocyte differentiation. Teumer et al. (1997) cloned and sequenced the basonuclin gene from a human genomic library. By analysis of human/rodent hybrid cells, they mapped it to chromosome

15. The transcription unit spans nearly 29 kb of sequence. The coding region is distributed over 5 exons and the 3 pairs of zinc fingers encoded by the last 2 exons. The 5-prime flanking sequence and first exon are unusually rich in GC content and in CpG dinucleotides. This sequence region contains numerous binding sites for the transcription factor Sp1 (OMIM Ref. No. 189906).

[8134] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8135] Tseng, H.; Green, H. : Basonuclin: a keratinocyte protein with multiple paired zinc fingers. Proc. Nat. Acad. Sci. 89: 10311–10315, 1992. ; and

[8136] Tseng, H.; Green, H. : Association of basonuclin with ability of keratinocytes to multiply and with absence of terminal differentiation. J. Cell Biol. 126: 495–506, 1994.

[8137] Further studies establishing the function and utilities of BNC are found in John Hopkins OMIM database record ID 601930, and in cited publications numbered 1448–1450 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein S (alpha) (PROS1, Accession XM_113400) is another VGAM274 host target gene. PROS1 BINDING SITE is HOST TARGET binding

site found in the 5` untranslated region of mRNA encoded by PROS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROS1 BINDING SITE, designated SEQ ID:3407, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:609.

[8138] Another function of VGAM274 is therefore inhibition of Protein S (alpha) (PROS1, Accession XM_113400). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROS1. FLJ20147 (Accession NM_017687) is another VGAM274 host target gene. FLJ20147 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20147, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20147 BINDING SITE, designated SEQ ID:1738, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:609.

[8139] Another function of VGAM274 is therefore inhibition of

FLJ20147 (Accession NM_017687). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20147. KIAA0737 (Accession NM_014828) is another VGAM274 host target gene. KIAA0737 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0737, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0737 BINDING SITE, designated SEQ ID:1562, to the nucleotide sequence of VGAM274 RNA, herein designated VGAM RNA, also designated SEQ ID:609.

[8140] Another function of VGAM274 is therefore inhibition of KIAA0737 (Accession NM_014828). Accordingly, utilities of VGAM274 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0737. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 275 (VGAM275) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[8141] VGAM275 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM275 was detected is described hereinabove with reference to Figs. 1–8.

[8142] VGAM275 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8143] VGAM275 gene encodes a VGAM275 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM275 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM275 precursor RNA is designated SEQ ID:261, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:261 is located at position 157919 relative to the genome of Vaccinia Virus.

[8144] VGAM275 precursor RNA folds onto itself, forming VGAM275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[8145] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM275 folded precursor RNA into VGAM275 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 84%) nucleotide se-
quence of VGAM275 RNA is designated SEQ ID:610, and is
provided hereinbelow with reference to the sequence list-
ing part.

[8146] VGAM275 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM275 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM275 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8147] VGAM275 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM275 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM275 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[8148] The complementary binding of VGAM275 RNA, herein designated VGAM RNA, to host target binding sites on VGAM275 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM275 host target RNA into VGAM275 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8149] It is appreciated that VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM275 host target genes. The mRNA of each one of this plurality of VGAM275 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM275 RNA, herein designated VGAM RNA, and which when bound by VGAM275 RNA causes inhibition of translation of respective one or more VGAM275 host target proteins.

[8150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM275 gene, herein designated VGAM GENE, on one or

more VGAM275 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8151] It is yet further appreciated that a function of VGAM275 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM275 correlate with, and may be deduced from, the identity of the host target genes which VGAM275 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [8152] Nucleotide sequences of the VGAM275 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM275 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM275 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM275 are further described hereinbelow with reference to Table 1.
- [8153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM275 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM275 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [8154] As mentioned hereinabove with reference to Fig. 1, a function of VGAM275 gene, herein designated VGAM is inhibition of expression of VGAM275 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM275 correlate with, and may be deduced from, the identity of the target genes which VGAM275 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [8155] Carbonic Anhydrase IV (CA4, Accession NM_000717) is a

VGAM275 host target gene. CA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CA4 BINDING SITE, designated SEQ ID:769, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8156] A function of VGAM275 is therefore inhibition of Carbonic Anhydrase IV (CA4, Accession NM_000717), a gene which has a function of reversible hydration of carbon dioxide. Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CA4. The function of CA4 has been established by previous studies. Carbonic anhydrases (CAs) are a family of zinc metalloenzymes. CA IV is a glycosylphosphatidylinositol-anchored membrane isozyme expressed on the luminal surfaces of pulmonary (and certain other) capillaries and on the luminal surface of proximal renal tubules. CA IV has ancient evolutionary status among CA isozymes. It is functionally important in CO₂ and bicarbonate transport and has a possible role in inherited renal

abnormalities of bicarbonate transport. Okuyama et al. (1992) isolated a full-length cDNA for human CA IV that contained a 47-bp 5-prime untranslated region, a 936-bp open reading frame, and a 122-bp 3-prime untranslated region. Okuyama et al. (1993) isolated a full-length genomic clone. They found that the 9.5-kb gene contains 8 exons and 7 introns. The first exon (exon 1a) encodes the signal sequence. Exon 7 encodes the C-terminus of the enzyme precursor, the C-terminus of the mature protein and the 120-bp sequence corresponding to the 3-prime untranslated region of the cDNA. Patients with renal abnormalities that selectively disturb bicarbonate transport, such as those with pure proximal renal tubular acidosis, are candidates for deficiency of carbonic anhydrase IV.

[8157] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8158] Okuyama, T.; Batanian, J. R.; Sly, W. S. : Genomic organization and localization of gene for human carbonic anhydrase IV to chromosome 17q. *Genomics* 16: 678-684, 1993. ; and

[8159] Okuyama, T.; Sato, S.; Zhu, X. L.; Waheed, A.; Sly, W. S. : Human carbonic anhydrase IV: cDNA cloning, sequence

comparison, and expression in COS cell membranes. Proc. Nat. Acad. Sci. 89.

[8160] Further studies establishing the function and utilities of CA4 are found in John Hopkins OMIM database record ID 114760, and in cited publications numbered 871–87 and 917–918 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lutheran Blood Group (Auberger b antigen included) (LU, Accession NM_005581) is another VGAM275 host target gene. LU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LU BINDING SITE, designated SEQ ID:1227, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8161] Another function of VGAM275 is therefore inhibition of Lutheran Blood Group (Auberger b antigen included) (LU, Accession NM_005581), a gene which is probably a receptor and may mediate intracellular signaling. Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with LU. The function of LU has been established by previous studies. Lutheran and Secretor (Se; OMIM Ref. No. FUT2, 182100) are linked (review by Cook, 1965). Indeed this was the first autosomal linkage demonstrated in man, by Dr. Jan Mohr (1951) in Copenhagen, using Penrose's sib-pair method. See 111150 for description of a dominant Lutheran inhibitor comparable to Bombay (OMIM Ref. No. 211100) and the ABO blood groups. Myotonic dystrophy (OMIM Ref. No. 160900) is linked to Lutheran and Secretor, and Lewis (OMIM Ref. No. 111100) and Bombay are in the same linkage group with C3 (OMIM Ref. No. 120700) on chromosome 19. Gedde-Dahl et al. (1984) found linkage of Se and APOE (OMIM Ref. No. 107741)--peak lod score 3.3 at recombination fraction 0.08 in males and 1.36 at 0.22 in females, and linkage of APOE and Lu with lod score 4.52 at zero recombination in sexes combined. C3-APOE linkage gave lod score 4.0 at theta 0.18 in males but 0.04 at theta 0.45 in females. Triple heterozygote families confirmed that APOE is on the Se side and on the Lu side of C3. A summarizing map was given (their Figure 3). Lewis et al. (1988) demonstrated that APOC2 (OMIM Ref. No. 207750), Lu, and Se constitute a tightly linked gene cluster and argued that Lu and Se are

on the long arm of chromosome 19 Parsons et al. (1997) determined the organization of the LU gene. The region encoding the open reading frame was arranged is 15 exons extending over approximately 11 kb on 19q13.2. They demonstrated that the Lu(a) mutation is a base change in exon 3 (252G→A; 111200.0001) encoding a change of arginine→77 in Lu(b) to histidine in Lu(a). The Lutheran glycoprotein has 5 predicted immunoglobulin superfamily domains; the base change responsible for the Lu(a)/Lu(b) polymorphism is located on domain 1. Parsons et al. (1997) also characterized the Au(a)/Au(b) polymorphism: a 1637A→G substitution in exon 12 (111200.0002) encoding a thr539→ala change on the G strand of domain 5. The predominant isoform of the Lutheran glycoprotein in most normal tissues is an 85,000–Da glycoprotein corresponding to the full-length LU cDNA, although in RBC membranes the minor 78,000–Da spliceoform can also be identified. The smaller form encoded by BCAM cDNA differs from Lutheran glycoprotein by lacking most of the cytoplasmic domain and arises by alternative splicing of an immature Lu gene transcript (Rahuel et al., 1996). Lutheran blood group glycoproteins are receptors for the extracellular matrix protein laminin. Studies sug-

gest that these glycoproteins may contribute to vasoocclusion in sickle cell disease (OMIM Ref. No. 603903), and sickle cells can be shown to adhere to laminin isoforms containing the alpha-5 chain (laminin-10/11). Laminin alpha-5 (LAMA5; 601033) is present in the subendothelium and is also a constituent of bone marrow sinusoids, suggesting a role for the Lu/laminin interaction in erythropoiesis. Parsons et al. (2001) cloned and characterized mouse Lu. The human and mouse proteins share 72% sequence identity and both bind laminin-10/11 with high affinity.

[8162] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8163] Parsons, S. F.; Lee, G.; Spring, F. A.; Willig, T.-N.; Peters, L. L.; Gimm, J. A.; Tanner, M. J. A.; Mohandas, N.; Anstee, D. J.; Chasis, J. A. : Lutheran blood group glycoprotein and its newly characterized mouse homologue specifically bind alpha-5 chain-containing human laminin with high affinity. *Blood* 97: 312-320, 2001. ; and

[8164] Cook, P. J. L. : The Lutheran-secretor recombination fraction in man: a possible sex difference. *Ann. Hum. Genet.* 28: 393-401, 1965.

[8165] Further studies establishing the function and utilities of LU are found in John Hopkins OMIM database record ID 111200, and in cited publications numbered 50–51, 49, 88–89, 2450–97, 88 and 99 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Formin Binding Protein 3 (FBNP3, Accession XM_087118) is another VGAM275 host target gene. FBNP3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FBNP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBNP3 BINDING SITE, designated SEQ ID:3155, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8166] Another function of VGAM275 is therefore inhibition of Formin Binding Protein 3 (FBNP3, Accession XM_087118). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBNP3. Sin3-associated Polypeptide, 18kDa (SAP18, Accession NM_005870) is another VGAM275 host target gene. SAP18 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by SAP18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SAP18 BINDING SITE, designated SEQ ID:1258, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8167] Another function of VGAM275 is therefore inhibition of Sin3-associated Polypeptide, 18kDa (SAP18, Accession NM_005870). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SAP18. SCYA4 (Accession NM_002984) is another VGAM275 host target gene. SCYA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA4 BINDING SITE, designated SEQ ID:978, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8168] Another function of VGAM275 is therefore inhibition of SCYA4 (Accession NM_002984). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA4. Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231) is another VGAM275 host target gene. SLC6A14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC6A14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A14 BINDING SITE, designated SEQ ID:1368, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8169] Another function of VGAM275 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter), Member 14 (SLC6A14, Accession NM_007231). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC6A14. LOC158629 (Accession XM_098972) is another VGAM275 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158629, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:3393, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8170] Another function of VGAM275 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. LOC163115 (Accession XM_092010) is another VGAM275 host target gene. LOC163115 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC163115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC163115 BINDING SITE, designated SEQ ID:3243, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8171] Another function of VGAM275 is therefore inhibition of LOC163115 (Accession XM_092010). Accordingly, utilities

of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC163115. LOC200339 (Accession XM_117226) is another VGAM275 host target gene. LOC200339 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:3476, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8172] Another function of VGAM275 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC200953 (Accession XM_117302) is another VGAM275 host target gene. LOC200953 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200953 BINDING SITE, designated SEQ ID:3481, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8173] Another function of VGAM275 is therefore inhibition of LOC200953 (Accession XM_117302). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200953. LOC255527 (Accession XM_173026) is another VGAM275 host target gene. LOC255527 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255527 BINDING SITE, designated SEQ ID:3718, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8174] Another function of VGAM275 is therefore inhibition of LOC255527 (Accession XM_173026). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255527. LOC51334 (Accession NM_016644) is another VGAM275 host target gene. LOC51334 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC51334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51334 BINDING SITE, designated SEQ ID:1706, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8175] Another function of VGAM275 is therefore inhibition of LOC51334 (Accession NM_016644). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51334. LOC92710 (Accession XM_046811) is another VGAM275 host target gene. LOC92710 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC92710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:2884, to the nucleotide sequence of VGAM275 RNA, herein designated VGAM RNA, also designated SEQ ID:610.

[8176] Another function of VGAM275 is therefore inhibition of

LOC92710 (Accession XM_046811). Accordingly, utilities of VGAM275 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 276 (VGAM276) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8177] VGAM276 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM276 was detected is described hereinabove with reference to Figs. 1–8.

[8178] VGAM276 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8179] VGAM276 gene encodes a VGAM276 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM276 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM276 precursor RNA is designated SEQ ID:262, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:262 is located at position 156818 relative to the genome of Vaccinia Virus.

[8180] VGAM276 precursor RNA folds onto itself, forming VGAM276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8181] An enzyme complex designated DICER COMPLEX, `dices` the VGAM276 folded precursor RNA into VGAM276 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 78%) nucleotide se-

quence of VGAM276 RNA is designated SEQ ID:611, and is provided hereinbelow with reference to the sequence listing part.

[8182] VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM276 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[8183] VGAM276 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM276 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM276 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8184] The complementary binding of VGAM276 RNA, herein designated VGAM RNA, to host target binding sites on VGAM276 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM276 host target RNA into VGAM276 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8185] It is appreciated that VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM276 host target genes. The mRNA of each one of this plurality of VGAM276 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM276 RNA, herein designated VGAM RNA, and which when bound by VGAM276 RNA causes inhibition of translation of respective one or more VGAM276 host target proteins.

[8186] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM276 gene, herein designated VGAM GENE, on one or more VGAM276 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8187] It is yet further appreciated that a function of VGAM276 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM276 correlate with, and may be deduced from, the identity of the host target genes which VGAM276 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8188] Nucleotide sequences of the VGAM276 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM276 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM276 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM276 are further described hereinbelow with reference to Table 1.

[8189] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM276 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM276 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8190] As mentioned hereinabove with reference to Fig. 1, a function of VGAM276 gene, herein designated VGAM is inhibition of expression of VGAM276 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM276 correlate with, and may be deduced from, the identity of the target genes which VGAM276 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8191] Translin (TSN, Accession NM_004622) is a VGAM276 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:1136, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8192] A function of VGAM276 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN

has been established by previous studies. Kasai et al. (1994) identified a protein they termed recombination hotspot-associated factor (RCHF1), which specifically binds to the signal-like sequences at the breakpoint junction of 8q24 and 1p32 in acute lymphoblastic leukemia (ALL) patients carrying t(8;14)(q24;q11) and t(1;14)(p32;q11) translocations involving the TCR delta-chain locus (TCRD; 186810). Aoki et al. (1994) showed that an analogous protein, which they designated BCLF1, specifically binds to a target sequence within the clustered breakpoint region of the BCL2 oncogene (OMIM Ref. No. 151430) in follicular lymphoma patients carrying t(14;18)(q32;q21) translocations. It was proposed that these binding activities at recombination hotspot regions may play a crucial role in chromosomal translocations in lymphoid neoplasms. Aoki et al. (1995) purified the BCLF1 protein to homogeneity and determined that it is identical to RCHF1. Molecular gene cloning experiments revealed that the purified protein, which they named translin (TSN), is a previously undescribed DNA-binding protein with no significant similarity to known proteins. (The designation 'translin' came from selected letters in 'translocation.') In addition, Aoki et al. (1995) found that nuclear localization

of translin was limited to lymphoid cell lines with rearranged Ig and processes such as DNA repair, replication, or recombination. In their native form, translin polypeptides form a multimeric structure that is responsible for its DNA binding activity. Aoki et al. (1997) found that the human and mouse translin genes have identical genomic structures consisting of 6 exons, 5 introns, and a GC-rich upstream region. By in situ hybridization and analysis of somatic cell hybrids, Aoki et al. (1997) mapped the human TSN gene to 2q21.1. Badge et al. (2000) studied a subtelomeric region at 16p13.3 that displays a 300-fold increase in crossovers compared to the genomic average rate. Segregation analysis of CEPH and other pedigrees yielded 6 paternal crossover breakpoints in the approximately 85-kb interval between the minisatellite loci D16S309 (MS205) and D16S83 (OMIM Ref. No. EKMDA2). Three crossovers were mapped to within the same small (less than 3 kb) interval, which did not colocalize with any tandem repeat array or expressed sequence. Sequence analysis revealed the presence of recombination-associated motifs and binding sites for translin. The authors concluded that this locus represents an intense male-specific recombination hotspot. Hosaka et al. (2000)

demonstrated that the presence of the translin binding motif may be one of the important determinants for the location of breakpoints in the TLS (OMIM Ref. No. 137070) and CHOP (OMIM Ref. No. 126337) genes which are fused by translocation t(12;16) in liposarcomas.

[8193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8194] Badge, R. M.; Yardley, J.; Jeffreys, A. J.; Armour, J. A. L. : Crossover breakpoint mapping identifies a subtelomeric hotspot for male meiotic recombination. Hum. Molec. Genet. 9: 1239–1244, 2000. ; and

[8195] Hosaka, T.; Kanoë, H.; Nakayama, T.; Murakami, H.; Yamamoto, H.; Nakamata, T.; Tsuboyama, T.; Oka, M.; Kasai, M.; Sasaki, M. S.; Nakamura, T.; Toguchida, J. : Translin binds to the sequ.

[8196] Further studies establishing the function and utilities of TSN are found in John Hopkins OMIM database record ID 600575, and in cited publications numbered 2154–215 and 2218–2221 listed in the bibliography section herein–below, which are also hereby incorporated by reference. FLJ20039 (Accession NM_017635) is another VGAM276 host target gene. FLJ20039 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20039, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20039 BINDING SITE, designated SEQ ID:1734, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8197] Another function of VGAM276 is therefore inhibition of FLJ20039 (Accession NM_017635). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20039. KIAA1204 (Accession XM_045011) is another VGAM276 host target gene. KIAA1204 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1204, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1204 BINDING SITE, designated SEQ ID:2849, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8198] Another function of VGAM276 is therefore inhibition of

KIAA1204 (Accession XM_045011). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1204. Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575) is another VGAM276 host target gene. OR2C3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OR2C3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OR2C3 BINDING SITE, designated SEQ ID:3023, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8199] Another function of VGAM276 is therefore inhibition of Olfactory Receptor, Family 2, Subfamily C, Member 3 (OR2C3, Accession XM_060575). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OR2C3. QKI (Accession XM_037438) is another VGAM276 host target gene. QKI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by QKI, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of QKI BINDING SITE, designated SEQ ID:2722, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8200] Another function of VGAM276 is therefore inhibition of QKI (Accession XM_037438). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with QKI. TIP120A (Accession NM_018448) is another VGAM276 host target gene. TIP120A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIP120A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIP120A BINDING SITE, designated SEQ ID:1828, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8201] Another function of VGAM276 is therefore inhibition of TIP120A (Accession NM_018448). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIP120A.

LOC90750 (Accession XM_033868) is another VGAM276 host target gene. LOC90750 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90750, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90750 BINDING SITE, designated SEQ ID:2673, to the nucleotide sequence of VGAM276 RNA, herein designated VGAM RNA, also designated SEQ ID:611.

[8202] Another function of VGAM276 is therefore inhibition of LOC90750 (Accession XM_033868). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90750. LOC92912 (Accession XM_047970) is another VGAM276 host target gene. LOC92912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92912 BINDING SITE, designated SEQ ID:2898, to the nucleotide sequence of VGAM276 RNA, herein designated

VGAM RNA, also designated SEQ ID:611.

[8203] Another function of VGAM276 is therefore inhibition of LOC92912 (Accession XM_047970). Accordingly, utilities of VGAM276 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92912. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 277 (VGAM277) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8204] VGAM277 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM277 was detected is described hereinabove with reference to Figs. 1–8.

[8205] VGAM277 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8206] VGAM277 gene encodes a VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM277 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM277 precursor RNA is designated SEQ ID:263, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:263 is located at position 157748 relative to the genome of Vaccinia Virus.

[8207] VGAM277 precursor RNA folds onto itself, forming VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8208] An enzyme complex designated DICER COMPLEX, `dices` the VGAM277 folded precursor RNA into VGAM277 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM277 RNA is designated SEQ ID:612, and is provided hereinbelow with reference to the sequence listing part.

[8209] VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM277 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8210] VGAM277 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM277 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM277 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8211] The complementary binding of VGAM277 RNA, herein designated VGAM RNA, to host target binding sites on VGAM277 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM277 host target RNA into VGAM277 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8212] It is appreciated that VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM277 host target genes. The mRNA of

each one of this plurality of VGAM277 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM277 RNA, herein designated VGAM RNA, and which when bound by VGAM277 RNA causes inhibition of translation of respective one or more VGAM277 host target proteins.

[8213] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM277 gene, herein designated VGAM GENE, on one or more VGAM277 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[8214] It is yet further appreciated that a function of VGAM277 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM277 correlate with, and may be deduced from, the identity of the host target genes which VGAM277 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8215] Nucleotide sequences of the VGAM277 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM277 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM277 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM277 are further described hereinbelow with reference to Table 1.

[8216] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM277 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM277 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[8217] As mentioned hereinabove with reference to Fig. 1, a function of VGAM277 gene, herein designated VGAM is inhibition of expression of VGAM277 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM277 correlate with, and may be deduced from, the identity of the target genes which VGAM277 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8218] BTB and CNC Homology 1, Basic Leucine Zipper Transcription Factor 2 (BACH2, Accession NM_021813) is a VGAM277 host target gene. BACH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BACH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BACH2 BINDING SITE, designated SEQ ID:1962, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8219] A function of VGAM277 is therefore inhibition of BTB and CNC Homology 1, Basic Leucine Zipper Transcription Fac-

tor 2 (BACH2, Accession NM_021813), a gene which acts as repressor or activator, binds to maf recognition elements. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BACH2. The function of BACH2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM119. Dual Specificity Phosphatase 11 (RNA/RNP complex 1-interacting) (DUSP11, Accession NM_003584) is another VGAM277 host target gene. DUSP11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DUSP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP11 BINDING SITE, designated SEQ ID:1039, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8220] Another function of VGAM277 is therefore inhibition of Dual Specificity Phosphatase 11 (RNA/RNP complex 1-interacting) (DUSP11, Accession NM_003584). Accordingly, utilities of VGAM277 include diagnosis, prevention

and treatment of diseases and clinical conditions associated with DUSP11. Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM_004447) is another VGAM277 host target gene. EPS8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EPS8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EPS8 BINDING SITE, designated SEQ ID:1114, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8221] Another function of VGAM277 is therefore inhibition of Epidermal Growth Factor Receptor Pathway Substrate 8 (EPS8, Accession NM_004447), a gene which has a role in normal and neoplastic cell proliferation; contains an SH3 motif. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EPS8. The function of EPS8 has been established by previous studies. Using an expression cloning approach for the study of epidermal growth factor (EGF) receptor (EGFR; 131550)-activated signaling, Wong et al. (1994) found a number of murine cDNA clones re-

ferred to as eps, for egfr-pathway-substrate. (See 600051 for one of these, EPS15.) One of the clones encoded a protein of 97 kD, designated eps8, which was phosphorylated in vivo by several receptor tyrosine kinases (Fazioli et al., 1993). In addition to a previously identified SH3 domain, Wong et al. (1994) found that the predicted amino acid sequence of human EPS8 showed a nonrandom distribution of prolines, clustered in a way to suggest SH3-binding sites and a putative PH domain. EPS8 was expressed in all epithelial and fibroblast cell lines examined and in some, but not all, hematopoietic cells. An essential function of EPS8 in cell growth regulation was underscored by its conservation during evolution where EPS8-related sequences were detected as early as in *S. cerevisiae*. EGFR signaling involves small GTPases of the Rho family, and EGFR trafficking involves small GTPases of the Rab family. Lanzetti et al. (2000) reported that the EPS8 protein connects these signaling pathways. EPS8 is a substrate of EGFR that is held in a complex with SOS1 by the adaptor protein E3B1, thereby mediating activation of RAC. Through its SH3 domain, EPS8 interacts with RNTRE (OMIM Ref. No. 605405). Lanzetti et al. (2000) showed that RNTRE is a RAB5 (OMIM Ref. No. 179512) GTPase-

activating protein whose activity is regulated by EGFR. By entering in a complex with EPS8, RNTRE acts on RAB5 and inhibits internalization of the EGFR. Furthermore, RNTRE diverts EPS8 from its RAC-activating function, resulting in the attenuation of RAC signaling. Thus, depending on its state of association with E3B1 or RNTRE, EPS8 participates in both EGFR signaling through RAC and EGFR trafficking through RAB5. Wong et al. (1994) mapped the human EPS8 locus to 12q23-q24 by study of human-rodent somatic cell hybrid DNAs and by fluorescence in situ hybridization. In an study of candidate genes for Noonan syndrome (OMIM Ref. No. 163950), Ion et al. (2000) reasigned the map position of EPS8 to 12q13 using FISH.

[8222] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8223] Wong, W. T.; Carlomagno, F.; Druck, T.; Barletta, C.; Croce, C. M.; Huebner, K.; Kraus, M. H.; Di Fiore, P. P. : Evolutionary conservation of the EPS8 gene and its mapping to human chromosome 12q23-q24. *Oncogene* 9: 3057-3061, 1994. ; and

[8224] Lanzetti, L.; Rybin, V.; Malabarba, M. G.; Christoforidis, S.; Scita, G.; Zerial, M.; Di Fiore, P. P. : The Eps8 protein coor-

ordinates EGF receptor signalling through Rac and trafficking t.

[8225] Further studies establishing the function and utilities of EPS8 are found in John Hopkins OMIM database record ID 600206, and in cited publications numbered 335, 44 and 495 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Thymidine Kinase 1, Soluble (TK1, Accession NM_003258) is another VGAM277 host target gene. TK1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TK1 BINDING SITE, designated SEQ ID:1005, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8226] Another function of VGAM277 is therefore inhibition of Thymidine Kinase 1, Soluble (TK1, Accession NM_003258). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TK1. Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6,

Accession NM_004621) is another VGAM277 host target gene. TRPC6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRPC6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRPC6 BINDING SITE, designated SEQ ID:1134, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8227] Another function of VGAM277 is therefore inhibition of Transient Receptor Potential Cation Channel, Subfamily C, Member 6 (TRPC6, Accession NM_004621), a gene which has calcium channel activity. Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRPC6. The function of TRPC6 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM97. KIAA0924 (Accession NM_014897) is another VGAM277 host target gene. KIAA0924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0924, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0924 BINDING SITE, designated SEQ ID:1577, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8228] Another function of VGAM277 is therefore inhibition of KIAA0924 (Accession NM_014897). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0924. KIAA1946 (Accession XM_092459) is another VGAM277 host target gene. KIAA1946 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1946, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1946 BINDING SITE, designated SEQ ID:3247, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8229] Another function of VGAM277 is therefore inhibition of KIAA1946 (Accession XM_092459). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1946. Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550) is another VGAM277 host target gene. OSBPL3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OSBPL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL3 BINDING SITE, designated SEQ ID:1635, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8230] Another function of VGAM277 is therefore inhibition of Oxysterol Binding Protein-like 3 (OSBPL3, Accession NM_015550). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL3. Protein Serine Kinase H1 (PSKH1, Accession XM_043047) is another VGAM277 host target gene. PSKH1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PSKH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of PSKH1 BINDING SITE, designated SEQ ID:2810, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8231] Another function of VGAM277 is therefore inhibition of Protein Serine Kinase H1 (PSKH1, Accession XM_043047). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSKH1. URB (Accession XM_087331) is another VGAM277 host target gene. URB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by URB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of URB BINDING SITE, designated SEQ ID:3162, to the nucleotide sequence of VGAM277 RNA, herein designated VGAM RNA, also designated SEQ ID:612.

[8232] Another function of VGAM277 is therefore inhibition of URB (Accession XM_087331). Accordingly, utilities of VGAM277 include diagnosis, prevention and treatment of diseases and clinical conditions associated with URB. Fig. 1 further provides a conceptual description of a novel

bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 278 (VGAM278) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8233] VGAM278 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM278 was detected is described hereinabove with reference to Figs. 1–8.

[8234] VGAM278 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8235] VGAM278 gene encodes a VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM278 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM278 precursor RNA is designated SEQ ID:264, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:264 is located at position 158423 relative to the genome of Vac–

cinia Virus.

[8236] VGAM278 precursor RNA folds onto itself, forming VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8237] An enzyme complex designated DICER COMPLEX, `dices` the VGAM278 folded precursor RNA into VGAM278 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 94%) nucleotide sequence of VGAM278 RNA is designated SEQ ID:613, and is provided hereinbelow with reference to the sequence listing part.

[8238] VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM278 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8239] VGAM278 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM278 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM278 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8240] The complementary binding of VGAM278 RNA, herein designated VGAM RNA, to host target binding sites on VGAM278 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM278 host target RNA into VGAM278 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8241] It is appreciated that VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM278 host target genes. The mRNA of each one of this plurality of VGAM278 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM278 RNA, herein designated VGAM RNA, and which when bound by VGAM278 RNA causes inhibition of translation of respective one or more VGAM278 host target proteins.

[8242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM278 gene, herein designated VGAM GENE, on one or more VGAM278 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8243] It is yet further appreciated that a function of VGAM278 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM278 correlate

with, and may be deduced from, the identity of the host target genes which VGAM278 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8244] Nucleotide sequences of the VGAM278 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM278 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM278 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM278 are further described hereinbelow with reference to Table 1.

[8245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM278 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM278 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8246] As mentioned hereinabove with reference to Fig. 1, a function of VGAM278 gene, herein designated VGAM is inhibition of expression of VGAM278 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM278 correlate with, and may be deduced

from, the identity of the target genes which VGAM278 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8247] Plastin 3 (T isoform) (PLS3, Accession NM_005032) is a VGAM278 host target gene. PLS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLS3 BINDING SITE, designated SEQ ID:1174, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:613.

[8248] A function of VGAM278 is therefore inhibition of Plastin 3 (T isoform) (PLS3, Accession NM_005032), a gene which binds actin. Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLS3. The function of PLS3 has been established by previous studies. Plastins are a family of actin-binding proteins that are differentially expressed in normal and malignant cells. Lin et al. (1988) isolated partial cDNAs encoding T-plastin and L-plastin (OMIM Ref. No. 153430) from a transformed human fibroblast

cDNA library. The C-terminal 570 amino acids of the T-plastin and L-plastin proteins are 83% identical. By 2-dimensional gel electrophoresis of human cell extracts, Lin et al. (1988) showed that T-plastin is expressed as 2 equally abundant isoforms. Northern blot analysis revealed that T-plastin is expressed as a 3.4-kb mRNA in normal cells of solid tissues and in transformed fibroblasts. Using anchored PCR, Lin et al. (1990) identified the 5-prime end of the T-plastin mRNA. The T-plastin transcript has 2 possible translation initiation codons which would result in predicted 627- and 630-amino acid proteins. The authors constructed 2 modified T-plastin cDNAs containing either the first or the second initiation codon. Expression of these cDNAs in *E. coli* resulted in the synthesis of 2 distinct T-plastins with the same isoelectric points and apparent molecular weights as the 2 T-plastins present in human cells. Lin et al. (1990) found that T-plastin contains a potential calcium-binding site near the N terminus. Lin et al. (1993) reported that both the L-plastin and T-plastin genes contain 16 exons and span approximately 90 kb

[8249] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [8252] Further studies establishing the function and utilities of PLS3 are found in John Hopkins OMIM database record ID 300131, and in cited publications numbered 13 and 2525 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. LOC121227 (Accession XM_058545) is another VGAM278 host target gene. LOC121227 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC121227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC121227 BINDING SITE, designated SEQ ID:2989, to the nucleotide sequence of

VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:613.

[8253] Another function of VGAM278 is therefore inhibition of LOC121227 (Accession XM_058545). Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC121227. LOC145786 (Accession XM_096860) is another VGAM278 host target gene. LOC145786 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145786 BINDING SITE, designated SEQ ID:3277, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:613.

[8254] Another function of VGAM278 is therefore inhibition of LOC145786 (Accession XM_096860). Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145786. LOC149650 (Accession XM_086623) is another VGAM278 host target gene. LOC149650 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC149650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149650 BINDING SITE, designated SEQ ID:3136, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:613.

[8255] Another function of VGAM278 is therefore inhibition of LOC149650 (Accession XM_086623). Accordingly, utilities of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149650. LOC222223 (Accession XM_168514) is another VGAM278 host target gene. LOC222223 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222223, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222223 BINDING SITE, designated SEQ ID:3641, to the nucleotide sequence of VGAM278 RNA, herein designated VGAM RNA, also designated SEQ ID:613.

[8256] Another function of VGAM278 is therefore inhibition of LOC222223 (Accession XM_168514). Accordingly, utilities

of VGAM278 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222223. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 279 (VGAM279) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8257] VGAM279 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM279 was detected is described hereinabove with reference to Figs. 1–8.

[8258] VGAM279 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8259] VGAM279 gene encodes a VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM279 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM279 precursor RNA is designated SEQ ID:265, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:265 is located at position 161106 relative to the genome of Vaccinia Virus.

[8260] VGAM279 precursor RNA folds onto itself, forming VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8261] An enzyme complex designated DICER COMPLEX, `dices` the VGAM279 folded precursor RNA into VGAM279 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM279 RNA is designated SEQ ID:614, and is

provided hereinbelow with reference to the sequence listing part.

[8262] VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM279 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8263] VGAM279 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM279 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM279 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8264] The complementary binding of VGAM279 RNA, herein designated VGAM RNA, to host target binding sites on VGAM279 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM279 host target RNA into VGAM279 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8265] It is appreciated that VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM279 host target genes. The mRNA of each one of this plurality of VGAM279 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM279 RNA, herein designated VGAM RNA, and which when bound by VGAM279 RNA causes inhibition of translation of respective one or more VGAM279 host target proteins.

[8266] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM279 gene, herein designated VGAM GENE, on one or more VGAM279 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8267] It is yet further appreciated that a function of VGAM279 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM279 correlate with, and may be deduced from, the identity of the host target genes which VGAM279 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8268] Nucleotide sequences of the VGAM279 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM279 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM279 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM279 are further described hereinbelow with reference to Table 1.

[8269] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM279 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM279 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8270] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM279 gene, herein designated VGAM is inhibition of expression of VGAM279 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM279 correlate with, and may be deduced from, the identity of the target genes which VGAM279 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8271] O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM_003605) is a VGAM279 host target gene. OGT BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OGT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OGT BINDING SITE, designated SEQ ID:1042, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8272] A function of VGAM279 is therefore inhibition of O-linked N-acetylglucosamine (GlcNAc) Transferase (UDP-N-acetylglucosamine:polypeptide-N-acetylglucosaminyl transferase) (OGT, Accession NM_003605), a gene

which has a role in the glycosylation of nuclear and cytoplasmic proteins. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OGT. The function of OGT has been established by previous studies. O-linked N-acetylglucosamine (O-GlcNAc) transferase (OGT) catalyzes the addition of a single N-acetylglucosamine in O-glycosidic linkage to serine or threonine residues. Since both phosphorylation and glycosylation compete for similar serine or threonine residues, the 2 processes may compete for sites, or they may alter the substrate specificity of nearby sites by steric or electrostatic effects (Lubas et al., 1997). Haltiwanger et al. (1992) purified rat liver OGT and determined that it has a molecular mass of 340 kD. They proposed that OGT exists as a heterotrimeric complex with 2 subunits of 110 kD and 1 of 78 kD. However, using rabbit OGT, Lubas et al. (1997) analyzed the proteolytic fingerprint of both polypeptides and found that the 2 are related. They suggested that the 78 kD band is a proteolytic product of the 110 kD polypeptide or the product of an alternative translation start site. Kreppel et al. (1997) cloned rat cDNAs encoding the 110-kD subunit. Immunofluorescence of human cells ex-

pressing rat OGT indicated that OGT is present in both the nucleus and cytosol.

[8273] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8274] Kreppel, L. K.; Blomberg, M. A.; Hart, G. W. : Dynamic glycosylation of nuclear and cytosolic proteins: cloning and characterization of a unique O-GlcNAc transferase with multiple tetratricopeptide repeats. J. Biol. Chem. 272: 9308–9315, 1997. ; and

[8275] Lubas, W. A.; Frank, D. W.; Krause, M.; Hanover, J. A. : O-linked GlcNAc transferase is a conserved nucleocytoplasmic protein containing tetratricopeptide repeats. J. Biol. Chem. 272: 9.

[8276] Further studies establishing the function and utilities of OGT are found in John Hopkins OMIM database record ID 300255, and in cited publications numbered 2032–2036 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842) is another VGAM279 host target gene. TNFRSF10B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by TNFRSF10B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFRSF10B BINDING SITE, designated SEQ ID:1065, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8277] Another function of VGAM279 is therefore inhibition of Tumor Necrosis Factor Receptor Superfamily, Member 10b (TNFRSF10B, Accession NM_003842), a gene which forms complex that induces apoptosis. Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFRSF10B. The function of TNFRSF10B has been established by previous studies. The 8p21 region contains a number of putative tumor suppressor genes and is a frequent site of translocations in head and neck tumors. Pai et al. (1998) determined the genomic structure of KILLER/DR5 and performed sequence analysis of all 10 coding exons in 20 primary head and neck cancers with allelic loss of 8p. To screen for a subset of mutations localized to the functional cytoplasmic death domain, they sequenced this region in an additional 40 primary head and neck cancers.

They found 2 alterations, including a 2-bp insertion at a minimal repeat site, introducing a premature stop codon and resulting in a truncated protein. This KILLER/DR5 mutation was also present in the germline of the affected patient, and the tumor did not have a p53 mutation by sequence analysis. Transfection studies in head and neck squamous cell carcinoma and colon and ovarian carcinoma cell lines revealed loss of growth suppressive function associated with the tumor-derived KILLER/DR5 truncation mutant. These observations provided the first evidence for mutation of a TRAIL death receptor gene in a human cancer, leading to loss of its apoptotic function. The second alteration identified by Pai et al. (1998) was a single T-to-C point mutation at residue 1109 that resulted in an amino acid change from val to ala. This mutation was not present in the germline; however, sequence analysis of p53 in this tumor revealed a point mutation of T to C in codon 242, resulting in a change from arg to cys. In a case of a head and neck squamous cell carcinoma (OMIM Ref. No. 601400), Pai et al. (1998) found a 2-bp insertion in the TNFRSF10B gene at a minimal repeat site (ACAC) at residue 1065, which introduced a premature stop codon and resulted in a truncated protein. Sequence

analysis of normal tissue from the patient showed that the truncating mutation was also present in the germline, and that the tumor did not have a p53 mutation. A significant impairment in the ability of the truncation mutant to suppress colony formation was observed when mutant cDNA was transfected into human colon and ovarian cancer cell lines. In the wildtype transfected cells, there was no observed colony survival; however, there was more than 50% colony growth in cells transfected with the tumor-derived mutant. Pai et al. (1998) suspected that the mutant retained partial function, because its overexpression in a background of cells containing the endogenous wildtype gene could further reduce the percentage of colony survival.

[8278] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8279] Pai, S. I.; Wu, G. S.; Ozoren, N.; Wu, L.; Jen, J.; Sidransky, D.; El-Deiry, W. S. : Rare loss-of-function mutation of a death receptor gene in head and neck cancer. *Cancer Res.* 58: 3513–3518, 1998. ; and

[8280] Screatton, G. R.; Mongkolsapaya, J.; Xu, X.-N.; Cowper, A. E.; McMichael, A. J.; Bell, J. I. : TRICK2, a new alternatively

spliced receptor that transduces the cytotoxic signal from TRAIL.

[8281] Further studies establishing the function and utilities of TNFRSF10B are found in John Hopkins OMIM database record ID 603612, and in cited publications numbered 1395, 669–67 and 1723–1724 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BA108L7.2 (Accession NM_030971) is another VGAM279 host target gene. BA108L7.2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BA108L7.2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BA108L7.2 BINDING SITE, designated SEQ ID:2180, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8282] Another function of VGAM279 is therefore inhibition of BA108L7.2 (Accession NM_030971). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BA108L7.2. FLJ12598 (Accession NM_024754) is another VGAM279 host target gene. FLJ12598 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ12598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12598 BINDING SITE, designated SEQ ID:2086, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8283] Another function of VGAM279 is therefore inhibition of FLJ12598 (Accession NM_024754). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12598. FLJ23071 (Accession NM_025192) is another VGAM279 host target gene. FLJ23071 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23071 BINDING SITE, designated SEQ ID:2144, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8284] Another function of VGAM279 is therefore inhibition of

FLJ23071 (Accession NM_025192). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23071. LOC91266 (Accession XM_037268) is another VGAM279 host target gene. LOC91266 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91266 BINDING SITE, designated SEQ ID:2720, to the nucleotide sequence of VGAM279 RNA, herein designated VGAM RNA, also designated SEQ ID:614.

[8285] Another function of VGAM279 is therefore inhibition of LOC91266 (Accession XM_037268). Accordingly, utilities of VGAM279 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 280 (VGAM280) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[8286] VGAM280 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM280 was detected is described hereinabove with reference to Figs. 1–8.

[8287] VGAM280 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8288] VGAM280 gene encodes a VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM280 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM280 precursor RNA is designated SEQ ID:266, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:266 is located at position 159680 relative to the genome of Vaccinia Virus.

[8289] VGAM280 precursor RNA folds onto itself, forming VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[8290] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM280 folded precursor RNA into VGAM280 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 83%) nucleotide se-
quence of VGAM280 RNA is designated SEQ ID:615, and is
provided hereinbelow with reference to the sequence list-
ing part.

[8291] VGAM280 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM280 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM280 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8292] VGAM280 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM280 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM280 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[8293] The complementary binding of VGAM280 RNA, herein designated VGAM RNA, to host target binding sites on VGAM280 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM280 host target RNA into VGAM280 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8294] It is appreciated that VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM280 host target genes. The mRNA of each one of this plurality of VGAM280 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM280 RNA, herein designated VGAM RNA, and which when bound by VGAM280 RNA causes inhibition of translation of respective one or more VGAM280 host target proteins.

[8295] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM280 gene, herein designated VGAM GENE, on one or

more VGAM280 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8296] It is yet further appreciated that a function of VGAM280 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM280 correlate with, and may be deduced from, the identity of the host target genes which VGAM280 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [8297] Nucleotide sequences of the VGAM280 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM280 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM280 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM280 are further described hereinbelow with reference to Table 1.
- [8298] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM280 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM280 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [8299] As mentioned hereinabove with reference to Fig. 1, a function of VGAM280 gene, herein designated VGAM is inhibition of expression of VGAM280 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM280 correlate with, and may be deduced from, the identity of the target genes which VGAM280 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [8300] Cadherin 11, Type 2, OB-cadherin (osteoblast) (CDH11,

Accession NM_033664) is a VGAM280 host target gene. CDH11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CDH11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH11 BINDING SITE, designated SEQ ID:2339, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8301] A function of VGAM280 is therefore inhibition of Cadherin 11, Type 2, OB-cadherin (osteoblast) (CDH11, Accession NM_033664), a gene which plays an role in development and maintenance of tissues. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH11. The function of CDH11 has been established by previous studies. Cadherins are a group of cell surface glycoproteins that mediate Ca^{2+} -dependent cell-cell adhesion (Tanihara et al., 1994). These proteins have a molecular mass of about 120 kD and are composed of an extracellular domain at the N-terminal end and a relatively small cytoplasmic domain at the C-terminal end; the 2 domains

are connected by a single membrane-spanning sequence. The extracellular domain consists of 5 subdomains, each of which contains a cadherin-specific motif. Cadherin expression is regulated spatially as well as temporally. Cadherins are thought to play an important role in development and maintenance of tissues through selective cell-cell adhesion activity and may be involved also in the invasion and metastasis of malignant tumors. Okazaki et al. (1994) identified a new member of the cadherin family, which they called OB (osteoblast)-cadherin, in a mouse osteoblastic cell line and human osteosarcoma. OB-cadherin was also weakly expressed in stroma cell lines that are the progenitor cells of osteoblasts. Expression of the CDHOB gene in the osteoblastic cell line was up-regulated during differentiation, suggesting a specific function in bone cell differentiation and bone formation. Two different forms of human OB-cadherin cDNA were cloned; one was a counterpart of the mouse gene and the other encoded a protein with a truncated cytoplasmic domain. The protein was designated cadherin-11 (symbol: CDH11) by the Human Genome Nomenclature Committee.

[8302] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

predominant expression in the brain and mapping on
chromosome 5p13-13. FEBS Lett. 452: 328-334, 1999. ;
and

[8304] Suzuki, S.; Sano, K.; Tanihara, H. : Diversity of the cad-
herin family: evidence for eight new cadherins in nervous
tissue. Cell Regul. 2: 261-270, 1991.

[8305] Further studies establishing the function and utilities of
CDH11 are found in John Hopkins OMIM database record
ID 600023, and in cited publications numbered 190 and
2681-1905 listed in the bibliography section hereinbelow,
which are also hereby incorporated by refer-
ence. Insulin-like Growth Factor 1 (somatomedin C) (IGF1,
Accession NM_000618) is another VGAM280 host target
gene. IGF1 BINDING SITE is HOST TARGET binding site
found in the 3' untranslated region of mRNA encoded by
IGF1, corresponding to a HOST TARGET binding site such
as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-
ble 2 illustrates the complementarity of the nucleotide se-
quences of IGF1 BINDING SITE, designated SEQ ID:761, to
the nucleotide sequence of VGAM280 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:615.

[8306] Another function of VGAM280 is therefore inhibition of Insulin-like Growth Factor 1 (somatomedin C) (IGF1, Accession NM_000618), a gene which are structurally and functionally related to insulin but have a much higher growth-promoting activity. Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGF1. The function of IGF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM34.FK506 Binding Protein 9, 63 KDa (FKBP9, Accession XM_168403) is another VGAM280 host target gene. FKBP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FKBP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP9 BINDING SITE, designated SEQ ID:3632, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8307] Another function of VGAM280 is therefore inhibition of FK506 Binding Protein 9, 63 KDa (FKBP9, Accession

XM_168403). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP9. FLJ23045 (Accession NM_024704) is another VGAM280 host target gene.

FLJ23045 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23045 BINDING SITE, designated SEQ ID:2082, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8308] Another function of VGAM280 is therefore inhibition of FLJ23045 (Accession NM_024704). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23045. FLJ30567 (Accession NM_145022) is another VGAM280 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:2510, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8309] Another function of VGAM280 is therefore inhibition of FLJ30567 (Accession NM_145022). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. FLJ30678 (Accession NM_144657) is another VGAM280 host target gene. FLJ30678 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ30678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30678 BINDING SITE, designated SEQ ID:2490, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8310] Another function of VGAM280 is therefore inhibition of FLJ30678 (Accession NM_144657). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30678. KIAA1676 (Accession XM_167612) is another VGAM280

host target gene. KIAA1676 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1676 BINDING SITE, designated SEQ ID:3590, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8311] Another function of VGAM280 is therefore inhibition of KIAA1676 (Accession XM_167612). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1676. Kruppel-like Factor 3 (basic) (KLF3, Accession NM_016531) is another VGAM280 host target gene. KLF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF3 BINDING SITE, designated SEQ ID:1693, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8312] Another function of VGAM280 is therefore inhibition of Kruppel-like Factor 3 (basic) (KLF3, Accession NM_016531). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF3. LOC146952 (Accession XM_097138) is another VGAM280 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:3286, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8313] Another function of VGAM280 is therefore inhibition of LOC146952 (Accession XM_097138). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146952. LOC81569 (Accession XM_030465) is another VGAM280 host target gene. LOC81569 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC81569, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC81569 BINDING SITE, designated SEQ ID:2616, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8314] Another function of VGAM280 is therefore inhibition of LOC81569 (Accession XM_030465). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC81569. LOC83690 (Accession NM_031461) is another VGAM280 host target gene. LOC83690 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC83690, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC83690 BINDING SITE, designated SEQ ID:2204, to the nucleotide sequence of VGAM280 RNA, herein designated VGAM RNA, also designated SEQ ID:615.

[8315] Another function of VGAM280 is therefore inhibition of LOC83690 (Accession NM_031461). Accordingly, utilities of VGAM280 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC83690. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 281 (VGAM281) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8316] VGAM281 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM281 was detected is described hereinabove with reference to Figs. 1–8.

[8317] VGAM281 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8318] VGAM281 gene encodes a VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM281 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM281 precursor RNA is designated SEQ

ID:267, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:267 is located at position 160226 relative to the genome of Vaccinia Virus.

[8319] VGAM281 precursor RNA folds onto itself, forming VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8320] An enzyme complex designated DICER COMPLEX, `dices` the VGAM281 folded precursor RNA into VGAM281 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM281 RNA is designated SEQ ID:616, and is provided hereinbelow with reference to the sequence list-

ing part.

[8321] VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM281 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8322] VGAM281 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM281 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM281 RNA, herein designated VGAM RNA, may

have a different number of host target binding sites in untranslated regions of a VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8323] The complementary binding of VGAM281 RNA, herein designated VGAM RNA, to host target binding sites on VGAM281 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM281 host target RNA into VGAM281 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8324] It is appreciated that VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM281 host target genes. The mRNA of each one of this plurality of VGAM281 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM281 RNA, herein designated VGAM

RNA, and which when bound by VGAM281 RNA causes inhibition of translation of respective one or more VGAM281 host target proteins.

[8325] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM281 gene, herein designated VGAM GENE, on one or more VGAM281 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8326] It is yet further appreciated that a function of VGAM281 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM281 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM281 correlate with, and may be deduced from, the identity of the host target genes which VGAM281 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8327] Nucleotide sequences of the VGAM281 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM281 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM281 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM281 are further described hereinbelow with reference to Table 1.

[8328] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM281 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM281 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8329] As mentioned hereinabove with reference to Fig. 1, a function of VGAM281 gene, herein designated VGAM is

inhibition of expression of VGAM281 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM281 correlate with, and may be deduced from, the identity of the target genes which VGAM281 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8330] Aspartate Beta-hydroxylase (ASPH, Accession NM_020164) is a VGAM281 host target gene. ASPH BINDING SITE1 and ASPH BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ASPH, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE1 and ASPH BINDING SITE2, designated SEQ ID:1896 and SEQ ID:2252 respectively, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8331] A function of VGAM281 is therefore inhibition of Aspartate Beta-hydroxylase (ASPH, Accession NM_020164), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins.

Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM170. Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044) is another VGAM281 host target gene. SLC6A12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC6A12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC6A12 BINDING SITE, designated SEQ ID:987, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8332] Another function of VGAM281 is therefore inhibition of Solute Carrier Family 6 (neurotransmitter transporter, betaine/GABA), Member 12 (SLC6A12, Accession NM_003044), a gene which transports betaine and gaba. Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with SLC6A12. The function of SLC6A12 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM85. Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989) is another VGAM281 host target gene. CSAD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSAD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSAD BINDING SITE, designated SEQ ID:1654, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8333] Another function of VGAM281 is therefore inhibition of Cysteine Sulfinic Acid Decarboxylase (CSAD, Accession NM_015989). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSAD. Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621) is another VGAM281 host target gene. DICER1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DICER1, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DICER1 BINDING SITE, designated SEQ ID:2151, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8334] Another function of VGAM281 is therefore inhibition of Dicer1, Dcr-1 Homolog (Drosophila) (DICER1, Accession NM_030621). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DICER1. KIAA1025 (Accession XM_034056) is another VGAM281 host target gene. KIAA1025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1025 BINDING SITE, designated SEQ ID:2675, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8335] Another function of VGAM281 is therefore inhibition of KIAA1025 (Accession XM_034056). Accordingly, utilities

of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1025. Kruppel-like Factor 12 (KLF12, Accession NM_007249) is another VGAM281 host target gene. KLF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:1372, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8336] Another function of VGAM281 is therefore inhibition of Kruppel-like Factor 12 (KLF12, Accession NM_007249). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12. Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714) is another VGAM281 host target gene. NFAT5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of NFAT5 BINDING SITE, designated SEQ ID:2451, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8337] Another function of VGAM281 is therefore inhibition of Nuclear Factor of Activated T-cells 5, Tonicity-responsive (NFAT5, Accession NM_138714). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFAT5. LOC170261 (Accession XM_093214) is another VGAM281 host target gene. LOC170261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC170261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC170261 BINDING SITE, designated SEQ ID:3256, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8338] Another function of VGAM281 is therefore inhibition of LOC170261 (Accession XM_093214). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC170261. LOC222602 (Accession XM_167171) is another VGAM281 host target gene. LOC222602 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222602, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222602 BINDING SITE, designated SEQ ID:3583, to the nucleotide sequence of VGAM281 RNA, herein designated VGAM RNA, also designated SEQ ID:616.

[8339] Another function of VGAM281 is therefore inhibition of LOC222602 (Accession XM_167171). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222602. LOC257051 (Accession XM_172800) is another VGAM281 host target gene. LOC257051 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257051, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257051 BINDING SITE, designated SEQ ID:3703, to the nucleotide sequence of VGAM281 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:616.

[8340] Another function of VGAM281 is therefore inhibition of LOC257051 (Accession XM_172800). Accordingly, utilities of VGAM281 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257051. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 282 (VGAM282) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8341] VGAM282 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM282 was detected is described hereinabove with reference to Figs. 1–8.

[8342] VGAM282 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8343] VGAM282 gene encodes a VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM282 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM282 precursor RNA is designated SEQ ID:268, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:268 is located at position 161325 relative to the genome of Vaccinia Virus.

[8344] VGAM282 precursor RNA folds onto itself, forming VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8345] An enzyme complex designated DICER COMPLEX, `dices` the VGAM282 folded precursor RNA into VGAM282 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM282 RNA is designated SEQ ID:617, and is provided hereinbelow with reference to the sequence listing part.

[8346] VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM282 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8347] VGAM282 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM282 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM282 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8348] The complementary binding of VGAM282 RNA, herein designated VGAM RNA, to host target binding sites on VGAM282 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM282 host target RNA into VGAM282 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8349] It is appreciated that VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM282 host target genes. The mRNA of

each one of this plurality of VGAM282 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM282 RNA, herein designated VGAM RNA, and which when bound by VGAM282 RNA causes inhibition of translation of respective one or more VGAM282 host target proteins.

[8350] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM282 gene, herein designated VGAM GENE, on one or more VGAM282 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[8351] It is yet further appreciated that a function of VGAM282 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM282 correlate with, and may be deduced from, the identity of the host target genes which VGAM282 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8352] Nucleotide sequences of the VGAM282 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM282 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM282 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM282 are further described hereinbelow with reference to Table 1.

[8353] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM282 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM282 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[8354] As mentioned hereinabove with reference to Fig. 1, a function of VGAM282 gene, herein designated VGAM is inhibition of expression of VGAM282 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM282 correlate with, and may be deduced from, the identity of the target genes which VGAM282 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8355] Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009) is a VGAM282 host target gene. FGF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF7 BINDING SITE, designated SEQ ID:886, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:617.

[8356] A function of VGAM282 is therefore inhibition of Fibroblast Growth Factor 7 (keratinocyte growth factor) (FGF7, Accession NM_002009), a gene which growth factor active

on keratinocytes. Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF7. The function of FGF7 has been established by previous studies. Rubin et al. (1989) identified a growth factor specific for epithelial cells in conditioned medium of a human embryonic lung fibroblast cell line. Because of its predominant activity in keratinocytes, it was referred to as keratinocyte growth factor. KGF was found to consist of a single polypeptide chain of about 28 kD. It was a potent mitogen for epithelial cells but lacked mitogenic activity on either fibroblasts or endothelial cells. Microsequencing showed an amino-terminal sequence containing no significant homology to any known protein. The release of this growth factor by human embryonic fibroblasts raised the possibility that KGF may play a role in mesenchymal stimulation of normal epithelial cell proliferation. In an addendum, Rubin et al. (1989) noted that by use of all the nucleotide probes based on the N-terminal sequence reported in their paper, they had isolated clones encoding KGF and had found significant structural homology between KGF and the other 5 known members of the fibroblast growth factor (FGF) family. Werner et al. (1994) assessed the function of KGF

in normal and wounded skin by expression of a dominant-negative KGF receptor (OMIM Ref. No. 176943) in basal keratinocytes. The skin of transgenic mice was characterized by epidermal atrophy, abnormalities in the hair follicles, and dermal hyperthickening. Upon skin injury, inhibition of KGF receptor signaling reduced the proliferation rate of epidermal keratinocytes at the wound edge, resulting in substantially delayed reepithelialization of the wound. Using a cosmid probe encoding KGF exon 1 for fluorescence in situ hybridization, Zimonjic et al. (1997) assigned the KGF7 gene to 15q15-q21.1. In addition, copies of KGF-like sequences hybridizing only with a cosmid probe encoding exons 2 and 3 were localized to dispersed sites on chromosome 2q21, 9p11, 9q12-q13, 18p11, 18q11, 21q11, and 21q21.1. The distribution of KGF-like sequences suggested a role for alphoid DNA in their amplification and dispersion. In chimpanzee, KGF-like sequences were observed at 5 chromosomal sites, which were each homologous to sites in human, while in gorilla a subset of 4 of these homologous sites was identified. In orangutan 2 sites were identified, while gibbon exhibited only a single site. The chromosomal localization of KGF sequences in human and great ape genomes indi-

cated that amplification and dispersion occurred in multiple discrete steps, with initial KGF gene duplication and dispersion occurring in multiple discrete steps, with initial KGF gene duplication and dispersion taking place in gibbon and involving loci corresponding to human chromosomes 15 and 21. The findings of Zimonjic et al. (1997) supported the concept of a closer evolutionary relationship of human with chimpanzee and with primates and a possible selective pressure for KGF dispersion during the evolution of higher primates.

[8357] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8358] Rubin, J. S.; Osada, H.; Finch, P. W.; Taylor, W. G.; Rudikoff, S.; Aaronson, S. A. : Purification and characterization of a newly identified growth factor specific for epithelial cells. Proc. Nat. Acad. Sci. 86: 802-806, 1989. ; and

[8359] Werner, S.; Smola, H.; Liao, X.; Longaker, M. T.; Krieg, T.; Hofschneider, P. H.; Williams, L. T. : The function of KGF in morphogenesis of epithelium and reepithelialization of wounds.

[8360] Further studies establishing the function and utilities of

FGF7 are found in John Hopkins OMIM database record ID 148180, and in cited publications numbered 2634–2638 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Melatonin Receptor 1B (MTNR1B, Accession NM_005959) is another VGAM282 host target gene. MTNR1B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTNR1B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTNR1B BINDING SITE, designated SEQ ID:1262, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:617.

[8361] Another function of VGAM282 is therefore inhibition of Melatonin Receptor 1B (MTNR1B, Accession NM_005959). Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTNR1B. Selenoprotein X, 1 (SEPX1, Accession NM_016332) is another VGAM282 host target gene. SEPX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPX1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEPX1 BINDING SITE, designated SEQ ID:1681, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:617.

[8362] Another function of VGAM282 is therefore inhibition of Selenoprotein X, 1 (SEPX1, Accession NM_016332). Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPX1. Protein Tyrosine Phosphatase, Receptor Type, F Polypeptide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM_046751) is another VGAM282 host target gene. PPFIA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPFIA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPFIA4 BINDING SITE, designated SEQ ID:2883, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:617.

[8363] Another function of VGAM282 is therefore inhibition of Protein Tyrosine Phosphatase, Receptor Type, F Polypep-

tide (PTPRF), Interacting Protein (liprin), Alpha 4 (PPFIA4, Accession XM_046751). Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPFIA4.

LOC145231 (Accession XM_096740) is another VGAM282 host target gene. LOC145231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145231 BINDING SITE, designated SEQ ID:3274, to the nucleotide sequence of VGAM282 RNA, herein designated VGAM RNA, also designated SEQ ID:617.

[8364] Another function of VGAM282 is therefore inhibition of LOC145231 (Accession XM_096740). Accordingly, utilities of VGAM282 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145231. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 283 (VGAM283) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8365] VGAM283 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM283 was detected is described hereinabove with reference to Figs. 1–8.

[8366] VGAM283 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8367] VGAM283 gene encodes a VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM283 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM283 precursor RNA is designated SEQ ID:269, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:269 is located at position 158874 relative to the genome of Vaccinia Virus.

[8368] VGAM283 precursor RNA folds onto itself, forming VGAM283 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[8369] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM283 folded precursor RNA into VGAM283 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 87%) nucleotide se-
quence of VGAM283 RNA is designated SEQ ID:618, and is
provided hereinbelow with reference to the sequence list-
ing part.

[8370] VGAM283 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM283 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM283 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8371] VGAM283 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM283 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM283 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8372] The complementary binding of VGAM283 RNA, herein designated VGAM RNA, to host target binding sites on VGAM283 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM283 host target RNA into VGAM283 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8373] It is appreciated that VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM283 host target genes. The mRNA of each one of this plurality of VGAM283 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM283 RNA, herein designated VGAM RNA, and which when bound by VGAM283 RNA causes inhibition of translation of respective one or more VGAM283 host target proteins.

[8374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM283 gene, herein designated VGAM GENE, on one or more VGAM283 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8375] It is yet further appreciated that a function of VGAM283 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM283 correlate with, and may be deduced from, the identity of the host target genes which VGAM283 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [8376] Nucleotide sequences of the VGAM283 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM283 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM283 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM283 are further described hereinbelow with reference to Table 1.
- [8377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM283 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM283 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [8378] As mentioned hereinabove with reference to Fig. 1, a function of VGAM283 gene, herein designated VGAM is inhibition of expression of VGAM283 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM283 correlate with, and may be deduced from, the identity of the target genes which VGAM283 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8379] Caveolin 3 (CAV3, Accession NM_033337) is a VGAM283 host target gene. CAV3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAV3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAV3 BINDING SITE, designated SEQ ID:2329, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8380] A function of VGAM283 is therefore inhibition of Caveolin 3 (CAV3, Accession NM_033337). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAV3. Homeo Box C4 (HOXC4, Accession NM_014620) is another VGAM283 host target gene. HOXC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HOXC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXC4 BINDING SITE, designated SEQ ID:1509, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also

designated SEQ ID:618.

[8381] Another function of VGAM283 is therefore inhibition of Homeo Box C4 (HOXC4, Accession NM_014620), a gene which is part of a developmental regulatory system that provides cells with specific positional identities on the anterior–posterior axis. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXC4. The function of HOXC4 has been established by previous studies. As reviewed by Acampora et al. (1989), the homeo box region 3, which maps to 12q12–q13, contains at least 7 homeo boxes in 160 kb of DNA. HOX3A is homologous to mouse Hox–3.1; HOX3B to mouse Hox–3.2; HOX3C to mouse Hox–6.1, and HOX3D to mouse Hox–6.2. The order of genes, from 5–prime to 3–prime, is HOX3G, HOX3F, HOX3B, HOX3A, HOX3C, HOX3D, HOX3E (Acampora et al., 1989). Masuda et al. (1991) mapped the feline equivalent to chromosome B4, which shares syntenic homology with human chromosome 12 and mouse chromosome 15. This gene is also called HOXC8; see HOXC9 (OMIM Ref. No. 142971). Yueh et al. (1998) showed that overexpression of a Hoxc8 transgene causes cartilage defects whose severity depends on transgene dosage. The abnormal car–

tilage is characterized by an accumulation of proliferating chondrocytes and reduced maturation. Since Hoxc8 is normally expressed in chondrocytes, these results suggested that Hoxc8 continues to regulate skeletal development well beyond pattern formation in a tissue-specific manner, presumably by controlling the progression of cells along the chondrocyte differentiation pathway. They found that Hoxd4 and Hoxc8 appear to act on chondrocyte differentiation in a similar manner. The protein sequences of the 2 share 67% identity within the homeodomain and 50% in the hexapeptide motif but little similarity in the remaining 70% of the molecules. Isl1, which shares no significant sequence similarities with Hoxc8 or Hoxd4, is not associated with abnormalities of skeletal development, implying that the cartilage abnormalities are specifically induced by HOX genes. The capacity of the HOX genes to regulate cartilage differentiation suggests that they may be involved in human chondrodysplasias or other cartilage disorders.

[8382] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8383] Simeone, A.; Pannese, M.; Acampora, D.; D'Esposito, M.;

Boncinelli, E. : At least three human homeoboxes on chromosome 12 belong to the same transcription unit. *Nucleic Acids Res.* 16: 5379–5390, 1988. ; and

[8384] Yueh, Y. G.; Gardner, D. P.; Kappen, C. : Evidence for regulation of cartilage differentiation by the homeobox gene *Hoxc-8*. *Proc. Nat. Acad. Sci.* 95: 9956–9961, 1998.

[8385] Further studies establishing the function and utilities of *HOXC4* are found in John Hopkins OMIM database record ID 142974, and in cited publications numbered 1189 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V-myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (*MYCL1*, Accession NM_005376) is another *VGAM283* host target gene. *MYCL1 BINDING SITE* is *HOST TARGET* binding site found in the 3' untranslated region of mRNA encoded by *MYCL1*, corresponding to a *HOST TARGET* binding site such as *BINDING SITE I*, *BINDING SITE II* or *BINDING SITE III*. Table 2 illustrates the complementarity of the nucleotide sequences of *MYCL1 BINDING SITE*, designated SEQ ID:1203, to the nucleotide sequence of *VGAM283* RNA, herein designated *VGAM RNA*, also designated SEQ ID:618.

[8386] Another function of *VGAM283* is therefore inhibition of V-

myc Myelocytomatosis Viral Oncogene Homolog 1, Lung Carcinoma Derived (avian) (MYCL1, Accession NM_005376), a gene which is a Myc-like transcription factor. Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYCL1. The function of MYCL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM152.FLJ20666 (Accession NM_017922) is another VGAM283 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:1762, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8387] Another function of VGAM283 is therefore inhibition of FLJ20666 (Accession NM_017922). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666.

KIAA1001 (Accession NM_014960) is another VGAM283 host target gene. KIAA1001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1001 BINDING SITE, designated SEQ ID:1599, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8388] Another function of VGAM283 is therefore inhibition of KIAA1001 (Accession NM_014960). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1001. Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320) is another VGAM283 host target gene. PGRMC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PGRMC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PGRMC2 BINDING SITE, designated SEQ ID:1286, to the nucleotide sequence of

VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8389] Another function of VGAM283 is therefore inhibition of Progesterone Receptor Membrane Component 2 (PGRMC2, Accession NM_006320). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PGRMC2.

LOC152286 (Accession XM_098188) is another VGAM283 host target gene. LOC152286 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152286 BINDING SITE, designated SEQ ID:3354, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8390] Another function of VGAM283 is therefore inhibition of LOC152286 (Accession XM_098188). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152286. LOC158549 (Accession XM_098963) is another VGAM283 host target gene. LOC158549 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158549 BINDING SITE, designated SEQ ID:3392, to the nucleotide sequence of VGAM283 RNA, herein designated VGAM RNA, also designated SEQ ID:618.

[8391] Another function of VGAM283 is therefore inhibition of LOC158549 (Accession XM_098963). Accordingly, utilities of VGAM283 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 284 (VGAM284) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8392] VGAM284 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM284 was detected is described hereinabove with reference to Figs. 1-8.

[8393] VGAM284 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8394] VGAM284 gene encodes a VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM284 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM284 precursor RNA is designated SEQ ID:270, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:270 is located at position 159230 relative to the genome of Vaccinia Virus.

[8395] VGAM284 precursor RNA folds onto itself, forming VGAM284 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[8396] An enzyme complex designated DICER COMPLEX, `dices` the VGAM284 folded precursor RNA into VGAM284 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM284 RNA is designated SEQ ID:619, and is provided hereinbelow with reference to the sequence listing part.

[8397] VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM284 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8398] VGAM284 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM284 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM284 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM284 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8399] The complementary binding of VGAM284 RNA, herein designated VGAM RNA, to host target binding sites on VGAM284 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM284 host target RNA into VGAM284 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8400] It is appreciated that VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM284 host target genes. The mRNA of each one of this plurality of VGAM284 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM284 RNA, herein designated VGAM RNA, and which when bound by VGAM284 RNA causes inhibition of translation of respective one or more VGAM284 host target proteins.

[8401] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM284 gene, herein designated VGAM GENE, on one or more VGAM284 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8402] It is yet further appreciated that a function of VGAM284 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM284 correlate with, and may be deduced from, the identity of the host target genes which VGAM284 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8403] Nucleotide sequences of the VGAM284 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM284 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM284 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM284 are further described hereinbelow with reference to Table 1.

[8404] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM284 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM284 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8405] As mentioned hereinabove with reference to Fig. 1, a function of VGAM284 gene, herein designated VGAM is inhibition of expression of VGAM284 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM284 correlate with, and may be deduced from, the identity of the target genes which VGAM284 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8406] DKFZp761G0313 (Accession XM_038026) is a VGAM284 host target gene. DKFZp761G0313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761G0313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of DK-FZp761G0313 BINDING SITE, designated SEQ ID:2731, to the nucleotide sequence of VGAM284 RNA, herein designated VGAM RNA, also designated SEQ ID:619.

[8407] A function of VGAM284 is therefore inhibition of DK-FZp761G0313 (Accession XM_038026). Accordingly, utilities of VGAM284 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761G0313. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 285 (VGAM285) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8408] VGAM285 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM285 was detected is described hereinabove with reference to Figs. 1-8.

[8409] VGAM285 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[8410] VGAM285 gene encodes a VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM285 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM285 precursor RNA is designated SEQ ID:271, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:271 is located at position 163176 relative to the genome of Vaccinia Virus.

[8411] VGAM285 precursor RNA folds onto itself, forming VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8412] An enzyme complex designated DICER COMPLEX, `dices` the VGAM285 folded precursor RNA into VGAM285 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM285 RNA is designated SEQ ID:620, and is provided hereinbelow with reference to the sequence listing part.

[8413] VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM285 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8414] VGAM285 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM285 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM285 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8415] The complementary binding of VGAM285 RNA, herein designated VGAM RNA, to host target binding sites on VGAM285 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM285 host target RNA into VGAM285 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8416] It is appreciated that VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM285 host target genes. The mRNA of each one of this plurality of VGAM285 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM285 RNA, herein designated VGAM RNA, and which when bound by VGAM285 RNA causes inhibition of translation of respective one or more VGAM285 host target proteins.

[8417] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM285 gene, herein designated VGAM GENE, on one or more VGAM285 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8418] It is yet further appreciated that a function of VGAM285 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM285 correlate with, and may be deduced from, the identity of the host target genes which VGAM285 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8419] Nucleotide sequences of the VGAM285 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM285 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM285 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM285 are further described hereinbelow with reference to Table 1.

[8420] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM285 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM285 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8421] As mentioned hereinabove with reference to Fig. 1, a function of VGAM285 gene, herein designated VGAM is inhibition of expression of VGAM285 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM285 correlate with, and may be deduced from, the identity of the target genes which VGAM285 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8422] Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010) is a VGAM285 host target gene. NRCAM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NRCAM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NRCAM BINDING SITE, designated SEQ ID:1170, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:620.

[8423] A function of VGAM285 is therefore inhibition of Neuronal Cell Adhesion Molecule (NRCAM, Accession NM_005010), a gene which functions as a cell surface protein and belongs to the immunoglobulin superfamily. Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NRCAM. The function of NRCAM has been established by previous studies. The cell adhesion molecules (CAMs) are a subset of the immunoglobulin (Ig) superfamily found in the nervous systems of both vertebrates and invertebrates. They are usually surface membrane proteins with multiple Ig domains at their N termini followed by several fibronectin type III repeats and either a transmembrane intracellular domain or a glycosylphosphatidylinositol-linked membrane anchor at the C terminus (Lane et al., 1996). The chicken Bravo/Nr-CAM was described by Grumet et al. (1991) and Kayyem et al. (1992) and shown to play a role in nervous system development. The protein interacts with other cell surface molecules of the Ig superfamily and appears to be necessary for specific pathfinding by axonal growth cones during development (Lane et al., 1996). Lane et al. (1996) cloned the human homolog (NRCAM) of the chicken gene from a fetal brain library. Like its chicken

counterpart, the predicted 1,275-amino acid protein has 6 V-like Ig domains and 5 fibronectin type III repeats. The transmembrane and intracellular domains of human and chicken NRCAM are entirely conserved and the proteins are 82% identical overall. Alternative splice variants were observed involving sequence around the fifth fibronectin repeat. Northern blots showed an approximately 7-kb transcript in all tissues of adult human brain examined.

[8424] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8425] Kayyem, J. F.; Roman, J. M.; de la Rosa, E. J.; Schwarz, U.; Dreyer, W. J. : Bravo/Nr-CAM is closely related to the cell adhesion molecules L1 and Ng-CAM and has a similar heterodimer structure. *J. Cell. Biol.* 118: 1259-1270, 1992. ; and

[8426] Lane, R. P.; Chen, X.-N.; Yamakawa, K.; Vielmetter, J.; Korenberg, J. R.; Dreyer, W. J. : Characterization of a highly conserved human homolog to the chicken neural cell surface protein.

[8427] Further studies establishing the function and utilities of NRCAM are found in John Hopkins OMIM database record ID 601581, and in cited publications numbered

1508–1512 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 22 Open Reading Frame 23 (C22orf23, Accession NM_032561) is another VGAM285 host target gene. C22orf23 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C22orf23, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C22orf23 BINDING SITE, designated SEQ ID:2259, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:620.

[8428] Another function of VGAM285 is therefore inhibition of Chromosome 22 Open Reading Frame 23 (C22orf23, Accession NM_032561). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C22orf23. SARM (Accession NM_015077) is another VGAM285 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:1609, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:620.

[8429] Another function of VGAM285 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. LOC219918 (Accession XM_166197) is another VGAM285 host target gene. LOC219918 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219918 BINDING SITE, designated SEQ ID:3529, to the nucleotide sequence of VGAM285 RNA, herein designated VGAM RNA, also designated SEQ ID:620.

[8430] Another function of VGAM285 is therefore inhibition of LOC219918 (Accession XM_166197). Accordingly, utilities of VGAM285 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219918. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 286 (VGAM286) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8431] VGAM286 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM286 was detected is described hereinabove with reference to Figs. 1–8.

[8432] VGAM286 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8433] VGAM286 gene encodes a VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM286 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM286 precursor RNA is designated SEQ ID:272, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:272 is

located at position 163795 relative to the genome of Vaccinia Virus.

[8434] VGAM286 precursor RNA folds onto itself, forming VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8435] An enzyme complex designated DICER COMPLEX, `dices` the VGAM286 folded precursor RNA into VGAM286 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM286 RNA is designated SEQ ID:621, and is provided hereinbelow with reference to the sequence listing part.

[8436] VGAM286 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM286 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8437] VGAM286 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM286 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM286 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM286 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8438] The complementary binding of VGAM286 RNA, herein designated VGAM RNA, to host target binding sites on VGAM286 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM286 host target RNA into VGAM286 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8439] It is appreciated that VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM286 host target genes. The mRNA of each one of this plurality of VGAM286 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM286 RNA, herein designated VGAM RNA, and which when bound by VGAM286 RNA causes inhibition of translation of respective one or more VGAM286

host target proteins.

[8440] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM286 gene, herein designated VGAM GENE, on one or more VGAM286 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8441] It is yet further appreciated that a function of VGAM286 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM286 correlate with, and may be deduced from, the identity of the host target genes which VGAM286 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8442] Nucleotide sequences of the VGAM286 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM286 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM286 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM286 are further described hereinbelow with reference to Table 1.

[8443] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM286 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM286 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8444] As mentioned hereinabove with reference to Fig. 1, a function of VGAM286 gene, herein designated VGAM is inhibition of expression of VGAM286 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM286 correlate with, and may be deduced from, the identity of the target genes which VGAM286 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8445] Fatty Acid Binding Protein 5 (psoriasis-associated) (FABP5, Accession NM_001444) is a VGAM286 host target gene. FABP5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FABP5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FABP5 BINDING SITE, designated SEQ ID:828, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8446] A function of VGAM286 is therefore inhibition of Fatty Acid Binding Protein 5 (psoriasis-associated) (FABP5, Accession NM_001444), a gene which may have a role keratinocyte differentiation, highly expressed in psoriatic skin. Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FABP5. The function of FABP5 has been established by previous studies. Fatty acid-binding proteins (FABPs) bind free fatty acids and regulate lipid

metabolism and transport. See also FABP3 (OMIM Ref. No. 134651). Using 2D gel electrophoresis, Madsen et al. (1992) isolated a fatty acid-binding protein, designated PAFABP for 'psoriasis-associated fatty acid-binding protein,' upregulated in noncultured psoriatic skin keratinocytes. The protein was microsequenced, and degenerate oligonucleotides based on the amino acid sequence were used to screen a lambda-gt11 cDNA library prepared from noncultured psoriatic keratinocytes. The PAFABP cDNA encodes a 135-amino acid protein with molecular weight 15,164. By Northern blot analysis, the authors detected elevated levels of PAFABP message in noncultured psoriatic keratinocytes as compared to normal keratinocytes. PAFABP mRNA was also observed in transformed human epithelial cell lines, A431 epidermoid carcinoma cells, transformed human amnion (AMA) cells, and lymphoid Molt 4 cells. PAFABP protein was increased in primary normal keratinocytes induced to differentiate, as determined by 2D gel electrophoresis. Siegenthaler et al. (1994) characterized EFABP, which they determined to be identical to PAFABP by peptide sequencing. EFABP is abundant in psoriatic skin lesions. Purified EFABP specifically and reversibly binds oleic, linoleic, and stearic acids,

but not cholesterol or retinoids. Use of antibodies specific for EFABP detected the protein in psoriatic lesions, heart, intestine, and adipose tissue. High levels of EFABP were also observed in abnormally differentiated epidermis. Immunohistochemistry localized EFABP to the stratum granulosum of normal skin.

[8447] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8448] Madsen, P.; Rasmussen, H. H.; Leffers, H.; Honore, B.; Celis, J. E. : Molecular cloning and expression of a novel keratinocyte protein (psoriasis-associated fatty acid-binding protein [PA-FABP]) that is highly up-regulated in psoriatic skin and that shares similarity to fatty acid-binding proteins. J. Invest. Derm. 99: 299-305, 1992. ; and

[8449] Siegenthaler, G.; Hotz, R.; Chatellard-Gruaz, D.; Didier-jean, L.; Hellman, U.; Saurat, J. H. : Purification and characterization of the human epidermal fatty acid-binding protein: local.

[8450] Further studies establishing the function and utilities of FABP5 are found in John Hopkins OMIM database record ID 605168, and in cited publications numbered 534-536

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222) is another VGAM286 host target gene. ZHX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZHX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZHX1 BINDING SITE, designated SEQ ID:1367, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8451] Another function of VGAM286 is therefore inhibition of Zinc-fingers and Homeoboxes 1 (ZHX1, Accession NM_007222). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZHX1. KIAA0981 (Accession XM_028867) is another VGAM286 host target gene. KIAA0981 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of KIAA0981 BINDING SITE, designated SEQ ID:2599, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8452] Another function of VGAM286 is therefore inhibition of KIAA0981 (Accession XM_028867). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0981. KIAA1615 (Accession XM_044021) is another VGAM286 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:2829, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8453] Another function of VGAM286 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. SGP28 (Accession NM_006061) is another

VGAM286 host target gene. SGP28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SGP28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SGP28 BINDING SITE, designated SEQ ID:1271, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8454] Another function of VGAM286 is therefore inhibition of SGP28 (Accession NM_006061). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SGP28. LOC201973 (Accession XM_114414) is another VGAM286 host target gene. LOC201973 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201973, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201973 BINDING SITE, designated SEQ ID:3456, to the nucleotide sequence of VGAM286 RNA, herein designated VGAM RNA, also designated SEQ ID:621.

[8455] Another function of VGAM286 is therefore inhibition of LOC201973 (Accession XM_114414). Accordingly, utilities of VGAM286 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201973. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 287 (VGAM287) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8456] VGAM287 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM287 was detected is described hereinabove with reference to Figs. 1–8.

[8457] VGAM287 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8458] VGAM287 gene encodes a VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM287

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM287 precursor RNA is designated SEQ ID:273, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:273 is located at position 163852 relative to the genome of Vaccinia Virus.

[8459] VGAM287 precursor RNA folds onto itself, forming VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8460] An enzyme complex designated DICER COMPLEX, `dices` the VGAM287 folded precursor RNA into VGAM287 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 73%) nucleotide sequence of VGAM287 RNA is designated SEQ ID:622, and is provided hereinbelow with reference to the sequence listing part.

[8461] VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM287 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8462] VGAM287 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM287 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM287 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8463] The complementary binding of VGAM287 RNA, herein designated VGAM RNA, to host target binding sites on VGAM287 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM287 host target RNA into VGAM287 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8464] It is appreciated that VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM287 host target genes. The mRNA of each one of this plurality of VGAM287 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM287 RNA, herein designated VGAM RNA, and which when bound by VGAM287 RNA causes inhibition of translation of respective one or more VGAM287 host target proteins.

[8465] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM287 gene, herein designated VGAM GENE, on one or more VGAM287 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8466] It is yet further appreciated that a function of VGAM287 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM287 correlate with, and may be deduced from, the identity of the host target genes which VGAM287 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8467] Nucleotide sequences of the VGAM287 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM287 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM287 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM287 are further described hereinbelow with reference to Table 1.

[8468] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM287 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM287 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[8469] As mentioned hereinabove with reference to Fig. 1, a function of VGAM287 gene, herein designated VGAM is inhibition of expression of VGAM287 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM287 correlate with, and may be deduced from, the identity of the target genes which VGAM287 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8470] LOC146237 (Accession XM_096954) is a VGAM287 host target gene. LOC146237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146237 BINDING SITE, designated SEQ ID:3283, to the nucleotide sequence of VGAM287 RNA, herein designated VGAM RNA, also designated SEQ ID:622.

[8471] A function of VGAM287 is therefore inhibition of LOC146237 (Accession XM_096954). Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146237. LOC255146 (Accession XM_170985) is another VGAM287 host target gene. LOC255146 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255146 BINDING SITE, designated SEQ ID:3679, to the nucleotide sequence of VGAM287 RNA, herein designated VGAM RNA, also designated SEQ ID:622.

[8472] Another function of VGAM287 is therefore inhibition of LOC255146 (Accession XM_170985). Accordingly, utilities of VGAM287 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255146. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 288 (VGAM288) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8473] VGAM288 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM288 was detected is described hereinabove with reference to Figs. 1–8.

[8474] VGAM288 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8475] VGAM288 gene encodes a VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM288 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM288 precursor RNA is designated SEQ ID:274, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:274 is located at position 166608 relative to the genome of Vaccinia Virus.

[8476] VGAM288 precursor RNA folds onto itself, forming VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8477] An enzyme complex designated DICER COMPLEX, `dices` the VGAM288 folded precursor RNA into VGAM288 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM288 RNA is designated SEQ ID:623, and is provided hereinbelow with reference to the sequence listing part.

[8478] VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM288 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8479] VGAM288 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM288 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM288 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8480] The complementary binding of VGAM288 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM288 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM288 host target RNA into VGAM288 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8481] It is appreciated that VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM288 host target genes. The mRNA of each one of this plurality of VGAM288 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM288 RNA, herein designated VGAM RNA, and which when bound by VGAM288 RNA causes inhibition of translation of respective one or more VGAM288 host target proteins.

[8482] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM288 gene, herein designated VGAM GENE, on one or more VGAM288 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8483] It is yet further appreciated that a function of VGAM288 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM288 correlate with, and may be deduced from, the identity of the host target genes which VGAM288 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8484] Nucleotide sequences of the VGAM288 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM288 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM288 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM288 are further described hereinbelow with reference to Table 1.

[8485] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM288 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM288 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8486] As mentioned hereinabove with reference to Fig. 1, a function of VGAM288 gene, herein designated VGAM is inhibition of expression of VGAM288 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM288 correlate with, and may be deduced from, the identity of the target genes which VGAM288 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8487] AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885) is a VGAM288 host target gene. ATBF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ATBF1, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATBF1 BINDING SITE, designated SEQ ID:1336, to the nucleotide sequence of VGAM288 RNA, herein designated VGAM RNA, also designated SEQ ID:623.

[8488] A function of VGAM288 is therefore inhibition of AT-binding Transcription Factor 1 (ATBF1, Accession NM_006885). Accordingly, utilities of VGAM288 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATBF1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 289 (VGAM289) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8489] VGAM289 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM289 was detected is described hereinabove with reference to Figs. 1-8.

[8490] VGAM289 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8491] VGAM289 gene encodes a VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM289 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM289 precursor RNA is designated SEQ ID:275, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:275 is located at position 168231 relative to the genome of Vaccinia Virus.

[8492] VGAM289 precursor RNA folds onto itself, forming VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8493] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM289 folded precursor RNA into VGAM289 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM289 RNA is designated SEQ ID:624, and is provided hereinbelow with reference to the sequence listing part.

[8494] VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM289 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8495] VGAM289 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM289 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM289 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8496] The complementary binding of VGAM289 RNA, herein designated VGAM RNA, to host target binding sites on VGAM289 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM289 host target RNA into VGAM289 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8497] It is appreciated that VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM289 host target genes. The mRNA of each one of this plurality of VGAM289 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM289 RNA, herein designated VGAM RNA, and which when bound by VGAM289 RNA causes inhibition of translation of respective one or more VGAM289 host target proteins.

[8498] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM289 gene, herein designated VGAM GENE, on one or more VGAM289 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8499] It is yet further appreciated that a function of VGAM289 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM289 correlate with, and may be deduced from, the identity of the host target genes which VGAM289 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8500] Nucleotide sequences of the VGAM289 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM289 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM289 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM289 are further described hereinbelow with reference to Table 1.

[8501] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM289 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM289 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8502] As mentioned hereinabove with reference to Fig. 1, a function of VGAM289 gene, herein designated VGAM is inhibition of expression of VGAM289 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM289 correlate with, and may be deduced from, the identity of the target genes which VGAM289 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8503] Fragile X Mental Retardation 2 (FMR2, Accession NM_002025) is a VGAM289 host target gene. FMR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FMR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FMR2 BINDING SITE, designated SEQ ID:889, to the nucleotide

sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8504] A function of VGAM289 is therefore inhibition of Fragile X Mental Retardation 2 (FMR2, Accession NM_002025). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FMR2. Splicing Factor 1 (SF1, Accession NM_004630) is another VGAM289 host target gene. SF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SF1 BINDING SITE, designated SEQ ID:1138, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8505] Another function of VGAM289 is therefore inhibition of Splicing Factor 1 (SF1, Accession NM_004630), a gene which is a transcriptional repressor and splicing factor. Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SF1. The function of SF1 has been established by previous studies. Toda et al. (1994) isolated a

gene, designated ZFM1 by them, from cosmids from the MEN1 (OMIM Ref. No. 131100) region of 11q13 using exon amplification. They then obtained cDNAs from cerebral, cerebellar, and fetal liver libraries. The predicted 623-amino acid protein contains a nuclear transport domain, a metal-binding or zinc finger motif, and glutamine- and proline-rich regions. It shows some sequence similarity to WT1 (OMIM Ref. No. 607102) and EGR2 (OMIM Ref. No. 129010). RT-PCR was used to show expression in the thyroid gland, pancreas, adrenal gland, and ovary. By differential screening of a cDNA library obtained from GMCSF (OMIM Ref. No. 138960)-stimulated human myeloid leukemia cells, Caslini et al. (1997) cloned 2 additional isoforms of the ZNF162 gene, designated B3 and B4, that encode 571- and 639-amino acid proteins, respectively. All of the ZNF162 isoforms contain a KH domain, a sequence motif present in proteins playing a major role in regulating cellular RNA metabolism.

[8506] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8507] Toda, T.; Iida, A.; Miwa, T.; Nakamura, Y.; Imai, T. : Isolation and characterization of a novel gene encoding nu-

clear protein at a locus (D11S636) tightly linked to multiple endocrine neoplasia type 1 (MEN1). Hum. Molec. Genet. 3: 465–470, 1994. ; and

[8509] Further studies establishing the function and utilities of SF1 are found in John Hopkins OMIM database record ID 601516, and in cited publications numbered 643, 89 and 1550 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BAL (Accession NM_031458) is another VGAM289 host target gene. BAL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAL BINDING SITE, designated SEQ ID:2201, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8510] Another function of VGAM289 is therefore inhibition of BAL (Accession NM_031458). Accordingly, utilities of

VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAL. Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048) is another VGAM289 host target gene.

BTN3A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BTN3A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTN3A1 BINDING SITE, designated SEQ ID:1355, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8511] Another function of VGAM289 is therefore inhibition of Butyrophilin, Subfamily 3, Member A1 (BTN3A1, Accession NM_007048). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTN3A1. Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644) is another VGAM289 host target gene. PDE4DIP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE4DIP, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4DIP BINDING SITE, designated SEQ ID:1512, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8512] Another function of VGAM289 is therefore inhibition of Phosphodiesterase 4D Interacting Protein (myomegalin) (PDE4DIP, Accession NM_014644). Accordingly, utilities of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4DIP. LOC200251 (Accession XM_114173) is another VGAM289 host target gene. LOC200251 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200251, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200251 BINDING SITE, designated SEQ ID:3447, to the nucleotide sequence of VGAM289 RNA, herein designated VGAM RNA, also designated SEQ ID:624.

[8513] Another function of VGAM289 is therefore inhibition of LOC200251 (Accession XM_114173). Accordingly, utilities

of VGAM289 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200251. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 290 (VGAM290) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8514] VGAM290 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM290 was detected is described hereinabove with reference to Figs. 1–8.

[8515] VGAM290 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8516] VGAM290 gene encodes a VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM290 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM290 precursor RNA is designated SEQ ID:276, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:276 is located at position 166723 relative to the genome of Vaccinia Virus.

[8517] VGAM290 precursor RNA folds onto itself, forming VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8518] An enzyme complex designated DICER COMPLEX, `dices` the VGAM290 folded precursor RNA into VGAM290 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 75%) nucleotide sequence of VGAM290 RNA is designated SEQ ID:625, and is

provided hereinbelow with reference to the sequence listing part.

[8519] VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM290 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[8520] VGAM290 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM290 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM290 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8521] The complementary binding of VGAM290 RNA, herein designated VGAM RNA, to host target binding sites on VGAM290 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM290 host target RNA into VGAM290 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8522] It is appreciated that VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM290 host target genes. The mRNA of each one of this plurality of VGAM290 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM290 RNA, herein designated VGAM RNA, and which when bound by VGAM290 RNA causes inhibition of translation of respective one or more VGAM290 host target proteins.

[8523] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM290 gene, herein designated VGAM GENE, on one or more VGAM290 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8524] It is yet further appreciated that a function of VGAM290 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM290 correlate with, and may be deduced from, the identity of the host target genes which VGAM290 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8525] Nucleotide sequences of the VGAM290 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM290 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM290 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM290 are further described hereinbelow with reference to Table 1.

[8526] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM290 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM290 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8527] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM290 gene, herein designated VGAM is inhibition of expression of VGAM290 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM290 correlate with, and may be deduced from, the identity of the target genes which VGAM290 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8528] Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_052988) is a VGAM290 host target gene. CDK10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDK10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDK10 BINDING SITE, designated SEQ ID:2354, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8529] A function of VGAM290 is therefore inhibition of Cyclin-dependent Kinase (CDC2-like) 10 (CDK10, Accession NM_052988), a gene which plays a pivotal role in the regulation of the eukaryotic cell cycle. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDK10.

The function of CDK10 has been established by previous studies. Cyclin-dependent kinases (CDKs) are CDC2 (OMIM Ref. No. 116940)-related kinases that bind to cyclin to form active holoenzymes that play a pivotal role in the regulation of the eukaryotic cell cycle. To identify additional CDC2-like protein kinases, Brambilla and Draetta (1994) performed RT-PCR on human tumor cell line mRNA using degenerate oligonucleotides based on regions conserved among CDC2-related proteins. They used a resulting PCR product to screen a HeLa cell library and isolated a partial cDNA encoding a novel protein kinase. The 5-prime end of the cDNA was obtained using RACE. Brambilla and Draetta (1994) designated the predicted 360-amino acid protein PISSLRE, based on the amino acid sequence of the region corresponding to the conserved CDC2 PSTAIRE motif. PISSLRE contains all the structural elements characteristic of CDKs and unique extensions at both ends. Sequence comparisons revealed that it shares 41% and 50% protein sequence identity with CDC2 and CDC2L1 (OMIM Ref. No. 176873), respectively. By Northern blot analysis, the authors determined that PISSLRE was expressed broadly in human tissues as a 2-kb mRNA. An additional 3.5-kb transcript was observed in some tis-

sues. Using a combination of library screening and 5-prime RACE, Grana et al. (1994) isolated PISSLRE cDNAs that differed significantly at both ends from those isolated by Brambilla and Draetta (1994). Brambilla and Draetta (1994) attributed the differences to alternative splicing. Grana et al. (1994) were unable to identify any ATG initiation codons upstream of the sequence encoding the catalytic domain of the putative kinase. They suggested that translation may initiate at 1 of 3 non-ATG initiation codons.

[8530] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8531] Bullrich, F.; MacLachlan, T. K.; Sang, N.; Druck, T.; Veronese, M. L.; Allen, S. L.; Chiorazzi, N.; Koff, A.; Heubner, K.; Croce, C. M.; Giordano, A. : Chromosomal mapping of members of the cdc2 family of protein kinases, cdk3, cdk6, PISSLRE, and PITALRE, and a cdk inhibitor, p27-Kip1, to regions involved in human cancer. *Cancer Res.* 55: 1199-1205, 1995. ; and

[8532] Grana, X.; Claudio, P. P.; De Luca, A.; Sang, N.; Giordano, A. : PISSLRE, a human novel CDC2-related protein kinase. *Oncogene* 9: 2097-2103, 1994.

[8533] Further studies establishing the function and utilities of CDK10 are found in John Hopkins OMIM database record ID 603464, and in cited publications numbered 66 and 664 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088) is another VGAM290 host target gene. COL1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL1A1 BINDING SITE, designated SEQ ID:704, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8534] Another function of VGAM290 is therefore inhibition of Collagen, Type I, Alpha 1 (COL1A1, Accession NM_000088). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL1A1. Espin (ESPN, Accession NM_031475) is another VGAM290 host target gene. ESPN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

ESPN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESPN BINDING SITE, designated SEQ ID:2210, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8535] Another function of VGAM290 is therefore inhibition of Espin (ESPN, Accession NM_031475), a gene which a membrane-cytoskeletal assemblages . Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESPN. The function of ESPN has been established by previous studies. Ectoplasmic specializations are membrane-cytoskeletal assemblages found in Sertoli cells at sites of attachment to elongate spermatids or neighboring Sertoli cells. Bartles et al. (1996) identified the rat actin-bundling protein espin, which is localized to ectoplasmic specializations. The 836-amino acid espin protein had a molecular mass of approximately 110 kD in SDS gels. Northern blot analysis detected a 2.9-kb espin transcript only in rat testis; a minor 1.7-kb transcript was detected in small intestine and kidney. Bartles et al. (1998) identified a 30-kD, 253-amino acid isoform of rat espin that localized

to brush border microvilli in the intestine and kidney. Espin and small espin share a 167-amino acid C-terminal peptide that includes a 116-amino acid C-terminal actin-bundling module that is necessary and sufficient for actin bundle formation in vitro; however, they contain different N termini. Bartles et al. (1998) and Chen et al. (1999) determined that unlike many actin-bundling proteins, the rat espins bind actin filaments with high affinity, and their actin-bundling activities are not inhibited by calcium. Zheng et al. (2000) determined that espins are present in hair cell stereocilia and uncovered a connection between the espin gene and jerker mouse, a recessive mutation that causes hair cell degeneration, deafness, and vestibular dysfunction. The tissues of jerker mice did not accumulate espin proteins but contained normal levels of espin mRNAs. The authors identified a frameshift mutation in the espin gene of jerker mice that affected the espin C-terminal actin-bundling module. These data suggested that jerker mice are espin null and that the jerker phenotype results from a mutation in the espin gene. Animal model experiments lend further support to the function of ESPN. Zheng et al. (2000) determined that espins are present in hair cell stereocilia and uncovered a connection

between the espin gene and jerker mouse, a recessive mutation that causes hair cell degeneration, deafness, and vestibular dysfunction. The tissues of jerker mice did not accumulate espin proteins but contained normal levels of espin mRNAs. The authors identified a frameshift mutation in the espin gene of jerker mice that affected the espin C-terminal actin-bundling module. These data suggested that jerker mice are espin null and that the jerker phenotype results from a mutation in the espin gene.

[8536] It is appreciated that the abovementioned animal model for ESPN is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8537] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8538] Chen, B.; Li, A.; Wang, D.; Wang, M.; Zheng, L.; Bartles, J. R. : Espin contains an additional actin-binding site in its N terminus and is a major actin-bundling protein of the Sertoli cell-spermatid ectoplasmic specialization junctional plaque. *Molec. Biol. Cell* 10: 4327-4339, 1999. ; and

[8539] Zheng, L.; Sekerkova, G.; Vranich, K.; Tilney, L. G.; Mugnaini, E.; Bartles, J. R. : The deaf jerker mouse has a muta-

tion in the gene encoding the espin actin-bundling proteins of hair.

[8540] Further studies establishing the function and utilities of ESPN are found in John Hopkins OMIM database record ID 606351, and in cited publications numbered 1492-1495 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Ionotropic, AMPA 1 (GRIA1, Accession NM_000827) is another VGAM290 host target gene. GRIA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIA1 BINDING SITE, designated SEQ ID:779, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8541] Another function of VGAM290 is therefore inhibition of Glutamate Receptor, Ionotropic, AMPA 1 (GRIA1, Accession NM_000827), a gene which acts as an excitatory neurotransmitter at many synapses in the central nervous system. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with GRIA1. The function of GRIA1 has been established by previous studies. To monitor changes in alpha-amino-3-hydroxy-5-methyl-4-isoxazole propionate (AMPA) receptor distribution in living neurons, Shi et al. (1999) tagged the AMPA receptor subunit GluR1 with green fluorescent protein (GFP). GluR1-GFP was functional and was transiently expressed in hippocampal CA1 neurons. In dendrites visualized with 2-photon laser scanning microscopy or electron microscopy, most of the GluR1-GFP was intracellular, mimicking endogenous GluR1 distribution. Tetanic synaptic stimulation induced a rapid delivery of tagged receptors into dendritic spines, as well as clusters in dendrite shafts. As they could be blocked by NMDA receptor antagonists, these postsynaptic trafficking events required synaptic NMDA receptor activation, and Shi et al. (1999) concluded that they may contribute to the enhanced AMPA receptor-mediated transmission observed during long-term potentiation and activity-dependent synaptic maturation. Animal model experiments lend further support to the function of GRIA1. Zamanillo et al. (1999) generated mice lacking the AMPA receptor subunit GluRA, also known as GluR1, by homologous recombination. Homozygous knockout mice

exhibited normal development, life expectancy, and fine structure of neuronal dendrites and synapses. They were smaller than their littermates during the first postnatal weeks, but after weaning their size was normal. In hippocampal CA1 pyramidal neurons, GluRA $-/-$ mice showed a reduction in functional AMPA receptors, with the remaining receptors preferentially targeted to synapses. Thus, the CA1 soma-patch currents were strongly reduced but glutamatergic synaptic currents were unaltered; evoked dendritic and spinous calcium currents, calcium-dependent gene activation, and hippocampal field potentials were as in wildtype. In adult GluRA $-/-$ mice, associative long-term potentiation was absent in CA3 to CA1 synapses, but spatial learning in the water maze was not impaired. The results suggested to Zamanillo et al. (1999) that CA1 hippocampal long-term potentiation is controlled by the number or subunit composition of AMPA receptors and show a dichotomy between long-term potentiation in CA1 and acquisition of spatial memory.

[8542] It is appreciated that the abovementioned animal model for GRIA1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8543] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8544] Shi, S.-H.; Hayashi, Y.; Petralla, R. S.; Zaman, S. H.; Wenthold, R. J.; Svoboda, K.; Malinow, R. : Rapid spine delivery and redistribution of AMPA receptors after synaptic NMDA receptor activation. Science 284: 1811–1816, 1999. ; and

[8545] Zamanillo, D.; Sprengel, R.; Hvalby, O.; Jensen, V.; Burnashev, N.; Rozov, A.; Kaiser, K. M. M.; Koster, H. J.; Borchardt, T.; Worley, P.; Lubke, J.; Frotscher, M.; Kelly, P. H.; Sommer.

[8546] Further studies establishing the function and utilities of GRIA1 are found in John Hopkins OMIM database record ID 138248, and in cited publications numbered 2666–85 and 2667 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM290 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of PLAG1 BINDING SITE, designated SEQ ID:942, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8547] Another function of VGAM290 is therefore inhibition of Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM50.SORCS1 (Accession NM_052918) is another VGAM290 host target gene. SORCS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORCS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORCS1 BINDING SITE, designated SEQ ID:2345, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8548] Another function of VGAM290 is therefore inhibition of

SORCS1 (Accession NM_052918). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORCS1. BM046 (Accession NM_018460) is another VGAM290 host target gene. BM046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BM046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM046 BINDING SITE, designated SEQ ID:1830, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8549] Another function of VGAM290 is therefore inhibition of BM046 (Accession NM_018460). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM046. Kruppel-like Factor 12 (KLF12, Accession NM_007249) is another VGAM290 host target gene. KLF12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of KLF12 BINDING SITE, designated SEQ ID:1373, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8550] Another function of VGAM290 is therefore inhibition of Kruppel-like Factor 12 (KLF12, Accession NM_007249). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLF12. Proteasome (prosome, macropain) Subunit, Alpha Type, 6 (PSMA6, Accession XM_046642) is another VGAM290 host target gene. PSMA6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PSMA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSMA6 BINDING SITE, designated SEQ ID:2880, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8551] Another function of VGAM290 is therefore inhibition of Proteasome (prosome, macropain) Subunit, Alpha Type, 6 (PSMA6, Accession XM_046642). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PSMA6. LOC157292 (Accession XM_098740) is another VGAM290 host target gene. LOC157292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157292 BINDING SITE, designated SEQ ID:3377, to the nucleotide sequence of VGAM290 RNA, herein designated VGAM RNA, also designated SEQ ID:625.

[8552] Another function of VGAM290 is therefore inhibition of LOC157292 (Accession XM_098740). Accordingly, utilities of VGAM290 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 291 (VGAM291) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8553] VGAM291 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM291 was detected is described hereinabove with reference to Figs. 1–8.

[8554] VGAM291 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8555] VGAM291 gene encodes a VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM291 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM291 precursor RNA is designated SEQ ID:277, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:277 is located at position 165333 relative to the genome of Vaccinia Virus.

[8556] VGAM291 precursor RNA folds onto itself, forming VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8557] An enzyme complex designated DICER COMPLEX, `dices` the VGAM291 folded precursor RNA into VGAM291 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM291 RNA is designated SEQ ID:626, and is provided hereinbelow with reference to the sequence listing part.

[8558] VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM291 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8559] VGAM291 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM291 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM291 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8560] The complementary binding of VGAM291 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM291 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM291 host target RNA into VGAM291 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8561] It is appreciated that VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM291 host target genes. The mRNA of each one of this plurality of VGAM291 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM291 RNA, herein designated VGAM RNA, and which when bound by VGAM291 RNA causes inhibition of translation of respective one or more VGAM291 host target proteins.

[8562] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM291 gene, herein designated VGAM GENE, on one or more VGAM291 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8563] It is yet further appreciated that a function of VGAM291 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM291 correlate with, and may be deduced from, the identity of the host target genes which VGAM291 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8564] Nucleotide sequences of the VGAM291 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM291 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM291 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM291 are further described hereinbelow with reference to Table 1.

[8565] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM291 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM291 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8566] As mentioned hereinabove with reference to Fig. 1, a function of VGAM291 gene, herein designated VGAM is inhibition of expression of VGAM291 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM291 correlate with, and may be deduced from, the identity of the target genes which VGAM291 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8567] Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407) is a VGAM291 host target gene. CELSR3

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CELSR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CELSR3 BINDING SITE, designated SEQ ID:825, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8568] A function of VGAM291 is therefore inhibition of Cadherin, EGF LAG Seven-pass G-type Receptor 3 (flamingo homolog, Drosophila) (CELSR3, Accession NM_001407), a gene which interacts in a homophilic manner in connecting cells. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CELSR3. The function of CELSR3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM162. Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200) is another VGAM291 host target gene. CMAR BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CMAR, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMAR BINDING SITE, designated SEQ ID:1195, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8569] Another function of VGAM291 is therefore inhibition of Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMAR. Fc Fragment of IgE, Low Affinity II, Receptor For (CD23A) (FCER2, Accession NM_002002) is another VGAM291 host target gene. FCER2 BINDING SITE1 through FCER2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FCER2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCER2 BINDING SITE1 through FCER2 BINDING SITE3, designated SEQ ID:881, SEQ ID:882 and SEQ ID:883 respectively, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8570] Another function of VGAM291 is therefore inhibition of Fc

Fragment of IgE, Low Affinity II, Receptor For (CD23A) (FCER2, Accession NM_002002), a gene which regulates the synthesis of IgE; contains an inverse RGD motif that binds to IgE. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCER2. The function of FCER2 has been established by previous studies. Ludin et al. (1987) cloned the cDNA coding for a human lymphocyte IgE receptor. Low-affinity receptors and secretor factors, which bind to immunoglobulins of the IgE isotype, play a key role in the regulation of human IgE synthesis. The nucleotide sequence of the cDNA predicted a polypeptide with 321 amino acids and a molecular weight of 36,281 daltons. The role of the IgE receptor in allergic diseases will be of interest. Furthermore, the receptor may be involved in determining the basic level of IgE in serum (OMIM Ref. No. 147050). The human leukocyte differentiation antigen CD23 (FCE2) is a key molecule for B-cell activation and growth. It is the low-affinity receptor for IgE. Furthermore, the truncated molecule can be secreted, then functioning as a potent mitogenic growth factor. Wendel-Hansen et al. (1990) showed by Southern analysis of DNAs from human/rodent cell hybrids that the CD23

gene is located on human chromosome 19. As part of a mapping of multiple probes to specific bands on chromosome 19 by fluorescence in situ hybridization, Trask et al. (1993) assigned the FCE2 gene to 19p13.3. Delespesse et al. (1989) studied the influence of IL4 and interferon on the production of CD23.

[8571] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8572] Ludin, C.; Hofstetter, H.; Sarfati, M.; Levy, C. A.; Suter, U.; Alaimo, D.; Kilchherr, E.; Frost, H.; Delespesse, G. : Cloning and expression of the cDNA coding for a human lymphocyte IgE receptor. EMBO J. 6: 109–114, 1987. ; and

[8573] Wendel–Hansen, V.; Riviere, M.; Uno, M.; Jansson, I.; Szpirer, J.; Islam, M. Q.; Levan, G.; Klein, G.; Yodoi, J.; Rosen, A.; Szpirer, C. : The gene encoding CD23 leukocyte antigen (FCE2).

[8574] Further studies establishing the function and utilities of FCER2 are found in John Hopkins OMIM database record ID 151445, and in cited publications numbered 78–7 and 1058 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NCSTN (Accession XM_057331) is another VGAM291 host target

gene. NCSTN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCSTN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCSTN BINDING SITE, designated SEQ ID:2979, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8575] Another function of VGAM291 is therefore inhibition of NCSTN (Accession XM_057331), a gene which has a central role in presenilin-mediated processing of beta-amyloid precursor protein (beta-APP, MIM 104760) and some aspects of notch (MIM 190198)/glp-1 signaling in vivo. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCSTN. The function of NCSTN has been established by previous studies. Nicastrin is a type 1 transmembrane glycoprotein that interacts with both presenilin-1 (PS1; OMIM Ref. No. 104311) and presenilin-2 (PS2; 600759) and has a central role in presenilin-mediated processing of beta-amyloid precursor protein (beta-APP, 104760) and some aspects of notch (OMIM

Ref. No. 190198)/glp-1 signaling in vivo. Nicastrin regulates gamma-secretase cleavage of the amyloid precursor protein by forming complexes with presenilins, in which most mutations causing familial early-onset Alzheimer disease (EOAD) have been found. The nicastrin gene maps to 1q23, a region that shows evidence for linkage to (Kehoe et al., 1999) and association with (Hiltunen et al., 2001) late-onset Alzheimer disease (LOAD). Dermaut et al. (2002) evaluated the contribution of genetic variations in NCSTN in 2 large series of patients with EOAD (onset at or before age 65 years) and LOAD (onset after age 65 years). In 78 familial EOAD cases, they found 14 NCSTN single-nucleotide polymorphisms (SNPs): 10 intronic SNPs, 3 silent mutations, and 1 missense mutation (N417Y). N417Y was thought not to be pathogenic, since it did not alter amyloid-beta secretion in an in vitro assay and its frequency was similar in case and control subjects. However, SNP haplotype estimation in 2 population-based series of Dutch patients with EOAD (n = 116) and LOAD (n = 240) indicated that the frequency of 1 SNP haplotype (designated HapB) was higher in the group with familial EOAD (7%), compared with the LOAD group (3%) and control group (3%). In patients with familial EOAD without the

APOE epsilon-4 allele (107741.0016), the HapB frequency further increased, to 14%, resulting in a 4-fold increased risk (odds ratio = 4.1). These results were considered compatible with an important role of gamma-secretase dysfunction in the etiology of familial EOAD.

[8576] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8577] Hiltunen, M.; Mannermaa, A.; Thompson, D.; Easton, D.; Pirskanen, M.; Helisalmi, S.; Koivisto, A. M.; Lehtovirta, M.; Ryyanen, M.; Soininen, H. : Genome-wide linkage disequilibrium mapping of late-onset Alzheimer's disease in Finland. *Neurology* 57: 1663-1668, 2001. ; and

[8578] Kehoe, P.; Wavrant-De Vrieze, F.; Crook, R.; Wu, W. S.; Holmans, P.; Fenton, I.; Spurlock, G.; Norton, N.; Williams, H.; Williams, N.; Lovestone, S.; Perez-Tur, J.; Hutton, J.; and 10.

[8579] Further studies establishing the function and utilities of NCSTN are found in John Hopkins OMIM database record ID 605254, and in cited publications numbered 976-983 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RNA Binding Motif Protein 10 (RBM10, Accession NM_005676) is another

VGAM291 host target gene. RBM10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM10 BINDING SITE, designated SEQ ID:1235, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8580] Another function of VGAM291 is therefore inhibition of RNA Binding Motif Protein 10 (RBM10, Accession NM_005676), a gene which has RNA-binding activity. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM10. The function of RBM10 has been established by previous studies. Nagase et al. (1995) cloned an RNA-binding protein as part of a random sequencing project of cDNAs from a myeloid cell line. They determined that this clone, which they termed KIAA0122, encodes a putative polypeptide of 880 amino acids that has significant homology with several RNA-binding proteins. They determined by Northern blotting that it is widely, perhaps ubiquitously, expressed. The S1 proteins are a

group of nuclear proteins which occur in association with hnRNA in the cell nucleus. Inoue et al. (1996) cloned a rat homolog of human KIAA0122, which they termed S1-1. Based on protein microsequences, they noted that the rat S1-1 sequence had 2 ribonucleoprotein (RNP) motifs but was distinct from other S1 proteins. They showed that the S1-1 protein has RNA-binding activity.

[8581] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8582] Inoue, A.; Takahashi, K. P.; Kimura, M.; Watanabe, T.; Morisawa, S. : Molecular cloning of a RNA binding protein, S1-1. Nucleic Acids Res. 24: 2990-2997, 1996. ; and

[8583] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121-KIAA0160).

[8584] Further studies establishing the function and utilities of RBM10 are found in John Hopkins OMIM database record ID 300080, and in cited publications numbered 2522-2524 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8,

Accession NM_001244) is another VGAM291 host target gene. TNFSF8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNFSF8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNFSF8 BINDING SITE, designated SEQ ID:812, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8585] Another function of VGAM291 is therefore inhibition of Tumor Necrosis Factor (ligand) Superfamily, Member 8 (TNFSF8, Accession NM_001244), a gene which cytokine that binds to tnfrsf8/cd30. induces proliferation of t cells. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNFSF8. The function of TNFSF8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM165.V-yes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is another VGAM291 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:1210, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8586] Another function of VGAM291 is therefore inhibition of Vyes-1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433), a gene which is a putative protein-tyrosine kinase. Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM256. Zinc Finger Protein 256 (ZNF256, Accession NM_005773) is another VGAM291 host target gene. ZNF256 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZNF256, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF256

BINDING SITE, designated SEQ ID:1247, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8587] Another function of VGAM291 is therefore inhibition of Zinc Finger Protein 256 (ZNF256, Accession NM_005773). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF256. HLA-B Associated Transcript 8 (BAT8, Accession NM_006709) is another VGAM291 host target gene. BAT8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAT8 BINDING SITE, designated SEQ ID:1325, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8588] Another function of VGAM291 is therefore inhibition of HLA-B Associated Transcript 8 (BAT8, Accession NM_006709). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT8. Complexin 1 (CPLX1,

Accession NM_006651) is another VGAM291 host target gene. CPLX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CPLX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CPLX1 BINDING SITE, designated SEQ ID:1318, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8589] Another function of VGAM291 is therefore inhibition of Complexin 1 (CPLX1, Accession NM_006651). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CPLX1. DKFZP566K0524 (Accession XM_045128) is another VGAM291 host target gene. DKFZP566K0524 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP566K0524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K0524 BINDING SITE, designated SEQ ID:2855, to the nucleotide sequence of

VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8590] Another function of VGAM291 is therefore inhibition of DKFZP566K0524 (Accession XM_045128). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K0524. FLJ12891 (Accession NM_024950) is another VGAM291 host target gene. FLJ12891 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12891, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12891 BINDING SITE, designated SEQ ID:2117, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8591] Another function of VGAM291 is therefore inhibition of FLJ12891 (Accession NM_024950). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12891. GR6 (Accession NM_007354) is another VGAM291 host target gene. GR6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by GR6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GR6 BINDING SITE, designated SEQ ID:1396, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8592] Another function of VGAM291 is therefore inhibition of GR6 (Accession NM_007354). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GR6. KIAA0455 (Accession XM_051785) is another VGAM291 host target gene. KIAA0455 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0455, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0455 BINDING SITE, designated SEQ ID:2947, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8593] Another function of VGAM291 is therefore inhibition of KIAA0455 (Accession XM_051785). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0455. KIAA0513 (Accession NM_014732) is another VGAM291 host target gene. KIAA0513 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0513, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0513 BINDING SITE, designated SEQ ID:1536, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8594] Another function of VGAM291 is therefore inhibition of KIAA0513 (Accession NM_014732). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0513. KIAA1655 (Accession XM_039442) is another VGAM291 host target gene. KIAA1655 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:2753, to the

nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8595] Another function of VGAM291 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. SCAN Domain Containing 2 (SCAND2, Accession NM_033634) is another VGAM291 host target gene. SCAND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCAND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCAND2 BINDING SITE, designated SEQ ID:2338, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8596] Another function of VGAM291 is therefore inhibition of SCAN Domain Containing 2 (SCAND2, Accession NM_033634). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCAND2. WD Repeat Domain 5B (WDR5B, Accession NM_019069) is another

VGAM291 host target gene. WDR5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR5B BINDING SITE, designated SEQ ID:1878, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8597] Another function of VGAM291 is therefore inhibition of WD Repeat Domain 5B (WDR5B, Accession NM_019069). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR5B. LOC146330 (Accession XM_085426) is another VGAM291 host target gene. LOC146330 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146330, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146330 BINDING SITE, designated SEQ ID:3088, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:626.

[8598] Another function of VGAM291 is therefore inhibition of LOC146330 (Accession XM_085426). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146330. LOC148181 (Accession XM_086083) is another VGAM291 host target gene. LOC148181 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC148181, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148181 BINDING SITE, designated SEQ ID:3117, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8599] Another function of VGAM291 is therefore inhibition of LOC148181 (Accession XM_086083). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148181. LOC150271 (Accession XM_097859) is another VGAM291 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150271, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:3326, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8600] Another function of VGAM291 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC150605 (Accession XM_097927) is another VGAM291 host target gene. LOC150605 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150605, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150605 BINDING SITE, designated SEQ ID:3331, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8601] Another function of VGAM291 is therefore inhibition of LOC150605 (Accession XM_097927). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC150605. LOC153277 (Accession XM_098346) is another VGAM291 host target gene. LOC153277 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153277, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153277 BINDING SITE, designated SEQ ID:3368, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8602] Another function of VGAM291 is therefore inhibition of LOC153277 (Accession XM_098346). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153277. LOC154990 (Accession XM_088109) is another VGAM291 host target gene. LOC154990 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC154990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154990 BINDING SITE, designated SEQ ID:3196, to

the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8603] Another function of VGAM291 is therefore inhibition of LOC154990 (Accession XM_088109). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154990. LOC158014 (Accession XM_088442) is another VGAM291 host target gene. LOC158014 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158014 BINDING SITE, designated SEQ ID:3209, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8604] Another function of VGAM291 is therefore inhibition of LOC158014 (Accession XM_088442). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158014. LOC158056 (Accession XM_088463) is another VGAM291 host target gene. LOC158056 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC158056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158056 BINDING SITE, designated SEQ ID:3210, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8605] Another function of VGAM291 is therefore inhibition of LOC158056 (Accession XM_088463). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158056. LOC202908 (Accession XM_114602) is another VGAM291 host target gene. LOC202908 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202908, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202908 BINDING SITE, designated SEQ ID:3462, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8606] Another function of VGAM291 is therefore inhibition of LOC202908 (Accession XM_114602). Accordingly, utilities

of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202908. LOC220143 (Accession XM_168046) is another VGAM291 host target gene. LOC220143 BINDING SITE1 and LOC220143 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC220143, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220143 BINDING SITE1 and LOC220143 BINDING SITE2, designated SEQ ID:3610 and SEQ ID:3611 respectively, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8607] Another function of VGAM291 is therefore inhibition of LOC220143 (Accession XM_168046). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220143. LOC255096 (Accession XM_174913) is another VGAM291 host target gene. LOC255096 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255096, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255096 BINDING SITE, designated SEQ ID:3744, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8608] Another function of VGAM291 is therefore inhibition of LOC255096 (Accession XM_174913). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255096. LOC255975 (Accession XM_171083) is another VGAM291 host target gene. LOC255975 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255975 BINDING SITE, designated SEQ ID:3686, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8609] Another function of VGAM291 is therefore inhibition of LOC255975 (Accession XM_171083). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC255975. LOC256878 (Accession XM_173042) is another VGAM291 host target gene. LOC256878 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256878, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256878 BINDING SITE, designated SEQ ID:3720, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8610] Another function of VGAM291 is therefore inhibition of LOC256878 (Accession XM_173042). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256878. LOC51333 (Accession NM_016643) is another VGAM291 host target gene. LOC51333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51333 BINDING SITE, designated SEQ ID:1705, to the nucleotide sequence of VGAM291 RNA, herein designated

VGAM RNA, also designated SEQ ID:626.

[8611] Another function of VGAM291 is therefore inhibition of LOC51333 (Accession NM_016643). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51333. LOC89919 (Accession XM_027244) is another VGAM291 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:2580, to the nucleotide sequence of VGAM291 RNA, herein designated VGAM RNA, also designated SEQ ID:626.

[8612] Another function of VGAM291 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM291 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 292 (VGAM292) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8613] VGAM292 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM292 was detected is described hereinabove with reference to Figs. 1–8.

[8614] VGAM292 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8615] VGAM292 gene encodes a VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM292 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM292 precursor RNA is designated SEQ ID:278, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:278 is located at position 165010 relative to the genome of Vaccinia Virus.

[8616] VGAM292 precursor RNA folds onto itself, forming

VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8617] An enzyme complex designated DICER COMPLEX, `dices` the VGAM292 folded precursor RNA into VGAM292 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM292 RNA is designated SEQ ID:627, and is provided hereinbelow with reference to the sequence listing part.

[8618] VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM292 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8619] VGAM292 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM292 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM292 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8620] The complementary binding of VGAM292 RNA, herein designated VGAM RNA, to host target binding sites on VGAM292 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM292 host target RNA into VGAM292 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8621] It is appreciated that VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM292 host target genes. The mRNA of each one of this plurality of VGAM292 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM292 RNA, herein designated VGAM RNA, and which when bound by VGAM292 RNA causes inhibition of translation of respective one or more VGAM292 host target proteins.

[8622] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM292 gene, herein designated VGAM GENE, on one or more VGAM292 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8623] It is yet further appreciated that a function of VGAM292 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM292 correlate with, and may be deduced from, the identity of the host target genes which VGAM292 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[8624] Nucleotide sequences of the VGAM292 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM292 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM292 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM292 are further described hereinbelow with reference to Table 1.

[8625] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM292 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM292 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8626] As mentioned hereinabove with reference to Fig. 1, a function of VGAM292 gene, herein designated VGAM is inhibition of expression of VGAM292 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM292 correlate with, and may be deduced from, the identity of the target genes which VGAM292 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[8627] Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417) is a VGAM292 host target gene. IL2RA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IL2RA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL2RA BINDING SITE, designated SEQ ID:739, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8628] A function of VGAM292 is therefore inhibition of Interleukin 2 Receptor, Alpha (IL2RA, Accession NM_000417), a gene which plays a role in T cell mediated immune response. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL2RA. The function of IL2RA has been established by previous studies. The action of the T-cell growth factor interleukin-2 (IL2; 147680) requires the presence of a cell surface receptor. As most peripheral as well as thymic T cells do not carry the receptor in vivo, the regulated expression of IL2R appears to be a safeguard against a catastrophic spread of T-cell proliferation by an

immunogenic stimulus. The receptor is a heterodimer, consisting of 1 alpha and 1 beta chain; the beta chain (OMIM Ref. No. 146710) was not characterized until 1989. The receptor molecule, a glycoprotein, has a relative mass of about 55,000. Its intracellular precursor is smaller. Leonard et al. (1983) used a monoclonal antibody for T-cell growth factor to characterize the receptor. Yang et al. (2001) analyzed T-cell subsets and levels of cytokine IL2 and soluble IL2 receptor in the peripheral blood of patients with normal pressure glaucoma (NPG; 606657) and primary open angle glaucoma (POAG; 137760) and compared them to values in age-matched controls. They found an increased frequency of CD8⁺/HLA-DR⁺ lymphocytes in patients with NPG and increased CD3⁺/CD8⁺ lymphocytes in both NPG and POAG patients. CD5⁺ lymphocytes were higher only in POAG patients. The mean concentration of soluble IL2R was higher in NPG and POAG patients than in controls although the IL2 concentration was similar in patients and controls. The authors concluded that the immune system might play an important role in initiation or progression of glaucomatous optic neuropathy in some patients.

[8629] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [8630] Leonard, W. J.; Donlon, T. A.; Lebo, R. V.; Greene, W. C. : Localization of the gene encoding the human interleukin-2 receptor on chromosome 10. Science 228: 1547-1549, 1985. ; and
- [8631] Yang, J.; Patil, R. V.; Yu, H.; Gordon, M.; Wax, M. B. : T cell subsets and sIL-2R/IL-2 levels in patients with glaucoma. Am. J. Ophthal. 131: 421-426, 2001.
- [8632] Further studies establishing the function and utilities of IL2RA are found in John Hopkins OMIM database record ID 147730, and in cited publications numbered 2562-2570, 2792, 2583-2584, 142, 2585-259 and 143 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169) is another VGAM292 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:3263, to the nu-

cleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8633] Another function of VGAM292 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 145kDa (INPP5D, Accession XM_096169), a gene which hydrolyzes Ins(1,3,4,5)P₄ and PtdIns(3,4,5)P₃; contains an SH2-domain. Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D has been established by previous studies. The phosphatidylinositols serve as precursors for a number of different messenger molecules. Agonist stimulation of cells results in phosphatidylinositol turnover and the generation of inositol 1,4,5-triphosphate (Ins(1,4,5)P₃), which mobilizes intracellular calcium. The inositol-polyphosphate 5-phosphatase (INPP5) enzymes hydrolyze Ins(1,4,5)P₃ in a signal-terminating reaction. Known INPP5s include the 40-kD INPP5A (OMIM Ref. No. 600106), the 75-kD INPP5B (OMIM Ref. No. 147264), and the enzyme associated with Lowe oculocerebrorenal syndrome (OMIM Ref. No. 309000). Damen et al. (1996) cloned and sequenced a cDNA encoding a 145-kD protein from a mouse hematopoietic cell line; the protein became

tyrosine phosphorylated and associated with SHC (OMIM Ref. No. 600560) after cytokine stimulation. Based on its domains and enzymatic activity, Damen et al. (1996) named this protein SHIP for 'SH2-containing inositol phosphatase. Liu et al. (1998) studied the expression of the Ship gene during mouse development. They found that the gene is expressed in late primitive-streak stage embryos (7.5 days post coitum), when hematopoiesis is thought to begin, and the expression is restricted to the hematopoietic lineage. In adult mice, Ship expression continues in most cells of hematopoietic origin, including granulocytes, monocytes, and lymphocytes, and is also found in the spermatids of the testis. Furthermore, the level of Ship expression is developmentally regulated during T-cell maturation. These results suggested a possible role for Ship in the differentiation and maintenance of the hematopoietic lineages and in spermatogenesis. Animal model experiments lend further support to the function of INPP5D. Because Ship $-/-$ mice contain increased numbers of osteoclast precursors, i.e., macrophages, Takeshita et al. (2002) examined bones from these animals and found that osteoclast number was increased 2-fold. The increased number was the result of prolonged lifespan of

these cells and hypersensitivity of precursors to macrophage colony-stimulating factor (MCSF; 120420) and receptor activator of nuclear factor-kappa-B ligand (RANKL; 602642). Similar to the osteoclasts of Paget disease of bone (OMIM Ref. No. 602080), Ship $-/-$ osteoclasts were enlarged, containing upwards of 100 nuclei, and exhibited enhanced resorptive activity. Moreover, as in Paget disease, serum levels of interleukin-6 (OMIM Ref. No. 147620) were markedly increased in Ship $-/-$ mice. Consistent with accelerated resorptive activity, a 22% loss of bone-mineral density and a 49% decrease in fracture energy were observed. Thus, SHIP negatively regulates osteoclast formation and function, and the absence of this enzyme results in severe osteoporosis

[8634] It is appreciated that the abovementioned animal model for INPP5D is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8635] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8636] Liu, Q.; Shalaby, F.; Jones, J.; Bouchard, D.; Dumont, D. J. : The SH2-containing inositol polyphosphate

5-phosphatase, Ship, is expressed during hematopoiesis and spermatogenesis. Blood 91: 2753–2759, 1998. ; and

[8637] Takeshita, S.; Namba, N.; Zhao, J. J.; Jiang, Y.; Genant, H. K.; Silva, M. J.; Brodt, M. D.; Helgason, C. D.; Kalesnikoff, J.; Rauh, M. J.; Humphries, R. K.; Krystal, G.; Teitelbaum, S.

[8638] Further studies establishing the function and utilities of INPP5D are found in John Hopkins OMIM database record ID 601582, and in cited publications numbered 1513–1523 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Plexin A1 (PLXNA1, Accession XM_051261) is another VGAM292 host target gene. PLXNA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNA1 BINDING SITE, designated SEQ ID:2941, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8639] Another function of VGAM292 is therefore inhibition of Plexin A1 (PLXNA1, Accession XM_051261). Accordingly, utilities of VGAM292 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with PLXNA1. Protein Kinase C, Nu (PRKCN, Accession NM_005813) is another VGAM292 host target gene. PRKCN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PRKCN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKCN BINDING SITE, designated SEQ ID:1253, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8640] Another function of VGAM292 is therefore inhibition of Protein Kinase C, Nu (PRKCN, Accession NM_005813). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKCN. Betaine-homocysteine Methyltransferase (BHMT, Accession NM_001713) is another VGAM292 host target gene. BHMT BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BHMT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of BHMT BINDING SITE, designated SEQ ID:849, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8641] Another function of VGAM292 is therefore inhibition of Betaine-homocysteine Methyltransferase (BHMT, Accession NM_001713). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHMT. DKFZP434B044 (Accession NM_031476) is another VGAM292 host target gene. DKFZP434B044 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434B044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434B044 BINDING SITE, designated SEQ ID:2211, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8642] Another function of VGAM292 is therefore inhibition of DKFZP434B044 (Accession NM_031476). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with DKFZP434B044. FLJ10458 (Accession NM_018096) is another VGAM292 host target gene. FLJ10458 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10458, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10458 BINDING SITE, designated SEQ ID:1777, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8643] Another function of VGAM292 is therefore inhibition of FLJ10458 (Accession NM_018096). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10458. FLJ20272 (Accession NM_017735) is another VGAM292 host target gene. FLJ20272 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20272, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20272 BINDING SITE, designated SEQ ID:1744, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:627.

[8644] Another function of VGAM292 is therefore inhibition of FLJ20272 (Accession NM_017735). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20272. FLJ23598 (Accession XM_170689) is another VGAM292 host target gene. FLJ23598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23598 BINDING SITE, designated SEQ ID:3665, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8645] Another function of VGAM292 is therefore inhibition of FLJ23598 (Accession XM_170689). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23598. KIAA1755 (Accession XM_028810) is another VGAM292 host target gene. KIAA1755 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1755, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1755 BINDING SITE, designated SEQ ID:2595, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8646] Another function of VGAM292 is therefore inhibition of KIAA1755 (Accession XM_028810). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1755. MGC21621 (Accession NM_145015) is another VGAM292 host target gene. MGC21621 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC21621, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC21621 BINDING SITE, designated SEQ ID:2508, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8647] Another function of VGAM292 is therefore inhibition of MGC21621 (Accession NM_145015). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC21621. MGC3077 (Accession NM_024051) is another VGAM292 host target gene. MGC3077 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3077, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3077 BINDING SITE, designated SEQ ID:2048, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8648] Another function of VGAM292 is therefore inhibition of MGC3077 (Accession NM_024051). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3077. MGC4707 (Accession NM_024113) is another VGAM292 host target gene. MGC4707 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC4707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC4707 BINDING SITE, designated SEQ ID:2055, to the nucleotide

sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8649] Another function of VGAM292 is therefore inhibition of MGC4707 (Accession NM_024113). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC4707. MGC5149 (Accession XM_051200) is another VGAM292 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:2940, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8650] Another function of VGAM292 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5149. RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401) is another VGAM292 host target gene. RAB3IL1 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by RAB3IL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB3IL1 BINDING SITE, designated SEQ ID:1448, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8651] Another function of VGAM292 is therefore inhibition of RAB3A Interacting Protein (rabin3)-like 1 (RAB3IL1, Accession NM_013401). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB3IL1. LOC119369 (Accession XM_061434) is another VGAM292 host target gene. LOC119369 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC119369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119369 BINDING SITE, designated SEQ ID:3026, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8652] Another function of VGAM292 is therefore inhibition of LOC119369 (Accession XM_061434). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119369. LOC150035 (Accession XM_097793) is another VGAM292 host target gene. LOC150035 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150035, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150035 BINDING SITE, designated SEQ ID:3321, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8653] Another function of VGAM292 is therefore inhibition of LOC150035 (Accession XM_097793). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150035. LOC219649 (Accession XM_167562) is another VGAM292 host target gene. LOC219649 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC219649, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219649 BINDING SITE, designated SEQ ID:3586, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8654] Another function of VGAM292 is therefore inhibition of LOC219649 (Accession XM_167562). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219649. LOC221688 (Accession XM_168085) is another VGAM292 host target gene. LOC221688 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221688, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221688 BINDING SITE, designated SEQ ID:3617, to the nucleotide sequence of VGAM292 RNA, herein designated VGAM RNA, also designated SEQ ID:627.

[8655] Another function of VGAM292 is therefore inhibition of LOC221688 (Accession XM_168085). Accordingly, utilities of VGAM292 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221688. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 293 (VGAM293) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8656] VGAM293 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM293 was detected is described hereinabove with reference to Figs. 1–8.

[8657] VGAM293 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8658] VGAM293 gene encodes a VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM293 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM293 precursor RNA is designated SEQ ID:279, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:279 is located at position 165185 relative to the genome of Vaccinia Virus.

[8659] VGAM293 precursor RNA folds onto itself, forming VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8660] An enzyme complex designated DICER COMPLEX, `dices` the VGAM293 folded precursor RNA into VGAM293 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM293 RNA is designated SEQ ID:628, and is provided hereinbelow with reference to the sequence listing part.

[8661] VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM293 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8662] VGAM293 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM293 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM293 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8663] The complementary binding of VGAM293 RNA, herein designated VGAM RNA, to host target binding sites on VGAM293 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM293 host target RNA into VGAM293 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8664] It is appreciated that VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM293 host target genes. The mRNA of each one of this plurality of VGAM293 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM293 RNA, herein designated VGAM RNA, and which when bound by VGAM293 RNA causes in-

hibition of translation of respective one or more VGAM293 host target proteins.

[8665] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM293 gene, herein designated VGAM GENE, on one or more VGAM293 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8666] It is yet further appreciated that a function of VGAM293 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM293 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM293 correlate with, and may be deduced from, the identity of the host target genes which VGAM293 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8667] Nucleotide sequences of the VGAM293 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM293 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM293 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM293 are further described hereinbelow with reference to Table 1.

[8668] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM293 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM293 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8669] As mentioned hereinabove with reference to Fig. 1, a function of VGAM293 gene, herein designated VGAM is inhibition of expression of VGAM293 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM293 correlate with, and may be deduced from, the identity of the target genes which VGAM293 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8670] Retinaldehyde Binding Protein 1 (RLBP1, Accession NM_000326) is a VGAM293 host target gene. RLBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by RLBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RLBP1 BINDING SITE, designated SEQ ID:729, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:628.

[8671] A function of VGAM293 is therefore inhibition of Retinaldehyde Binding Protein 1 (RLBP1, Accession NM_000326). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RLBP1. MGC23280 (Accession NM_144683) is another VGAM293 host target gene. MGC23280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by MGC23280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23280 BINDING SITE, designated SEQ ID:2493, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:628.

[8672] Another function of VGAM293 is therefore inhibition of MGC23280 (Accession NM_144683). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23280. LOC113523 (Accession XM_054378) is another VGAM293 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:2966, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:628.

[8673] Another function of VGAM293 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities

of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC150157 (Accession XM_097823) is another VGAM293 host target gene. LOC150157 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150157, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150157 BINDING SITE, designated SEQ ID:3325, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:628.

[8674] Another function of VGAM293 is therefore inhibition of LOC150157 (Accession XM_097823). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150157. LOC196890 (Accession XM_116951) is another VGAM293 host target gene. LOC196890 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC196890, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC196890 BINDING SITE, designated SEQ ID:3468, to the nucleotide sequence of VGAM293 RNA, herein designated VGAM RNA, also designated SEQ ID:628.

[8675] Another function of VGAM293 is therefore inhibition of LOC196890 (Accession XM_116951). Accordingly, utilities of VGAM293 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196890. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 294 (VGAM294) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8676] VGAM294 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM294 was detected is described hereinabove with reference to Figs. 1–8.

[8677] VGAM294 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8678] VGAM294 gene encodes a VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM294 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM294 precursor RNA is designated SEQ ID:280, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:280 is located at position 165538 relative to the genome of Vaccinia Virus.

[8679] VGAM294 precursor RNA folds onto itself, forming VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8680] An enzyme complex designated DICER COMPLEX, `dices` the VGAM294 folded precursor RNA into VGAM294 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 90%) nucleotide sequence of VGAM294 RNA is designated SEQ ID:629, and is provided hereinbelow with reference to the sequence listing part.

[8681] VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM294 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8682] VGAM294 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM294 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM294 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8683] The complementary binding of VGAM294 RNA, herein designated VGAM RNA, to host target binding sites on VGAM294 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM294 host target RNA into VGAM294 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8684] It is appreciated that VGAM294 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM294 host target genes. The mRNA of each one of this plurality of VGAM294 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM294 RNA, herein designated VGAM RNA, and which when bound by VGAM294 RNA causes inhibition of translation of respective one or more VGAM294 host target proteins.

[8685] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM294 gene, herein designated VGAM GENE, on one or more VGAM294 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[8686] It is yet further appreciated that a function of VGAM294 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM294 correlate with, and may be deduced from, the identity of the host target genes which VGAM294 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8687] Nucleotide sequences of the VGAM294 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM294 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM294 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM294 are further described hereinbelow with reference to Table 1.

[8688] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM294 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM294 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8689] As mentioned hereinabove with reference to Fig. 1, a function of VGAM294 gene, herein designated VGAM is inhibition of expression of VGAM294 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM294 correlate with, and may be deduced from, the identity of the target genes which VGAM294 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8690] Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is a VGAM294 host target gene. ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARHGAP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE1 and ARHGAP6 BINDING SITE2, designated SEQ ID:807 and SEQ ID:1450 respectively, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM

RNA, also designated SEQ ID:629.

[8691] A function of VGAM294 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 has been established by previous studies. In a search for the genetic defect in microphthalmia with linear skin defects syndrome (MLS; 309801), Schaefer et al. (1997) trapped exons from 14 overlapping cosmids from the 500-kb MLS critical region in Xp22.3. Using exon connection followed by cDNA library screening, they identified a 2.4-kb contig of cDNA clones spanning 170 kb of genomic sequence in the MLS deletion region. Northern analysis of this cDNA detected a prominent transcript of approximately 4.2 kb and a less abundant transcript of approximately 6 kb in all tissues examined, with additional transcripts in skeletal muscle. Sequence analysis revealed a coding region of 601 amino acids contained in 12 exons, with a splice variant isoform of 495 amino acids. The predicted protein sequence of the gene, symbolized ARHGAP6, contains ho-

mology to the GTPase-activating (GAP) domain of the Rho-GAP family of proteins (e.g., 300023), which has been implicated in the regulation of actin polymerization at the plasma membrane in several cellular processes. Schaefer et al. (1997) discussed reasons for thinking that a defect in the Rho pathway may play a role in the pathogenesis of MLS syndrome. Prakash et al. (2000) investigated the function of ARHGAP6 by generating *Arhgap6* null mice and also by in vitro expression studies. Surprisingly, loss of the rhoGAP function of *Arhgap6* did not cause any detectable phenotypic or behavioral abnormalities in the mutant mice. Transfected mammalian cells expressing ARHGAP6 lost their actin stress fibers, retracted from the growth surface, and extended thin, branching processes resembling filopodia. The ARHGAP6 protein colocalized with actin filaments through an N-terminal domain and recruited filamentous actin into the growing processes. Mutation of a conserved arginine residue in the rhoGAP domain prevented the loss of stress fibers but had little effect on process outgrowth. The authors concluded that ARHGAP6 has 2 independent functions: one as a GAP with specificity for RhoA and the other as a cytoskeletal protein that promotes actin remodeling.

- [8692] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [8694] Schaefer, L.; Prakash, S.; Zoghbi, H. Y. : Cloning and characterization of a novel rho-type GTPase-activating protein gene (ARHGAP6) from the critical region for microphthalmia with li.
- [8695] Further studies establishing the function and utilities of ARHGAP6 are found in John Hopkins OMIM database record ID 300118, and in cited publications numbered 2432–2433 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Basonuclin (BNC, Accession NM_001717) is another VGAM294 host target gene. BNC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BNC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of BNC BINDING SITE, designated SEQ ID:850, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:629.

[8696] Another function of VGAM294 is therefore inhibition of Basonuclin (BNC, Accession NM_001717), a gene which plays a role in the maintenance of proliferative capacity and prevention of terminal differentiation of keratinocytes. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BNC. The function of BNC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM274. CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM_001310) is another VGAM294 host target gene. CREBL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CREBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CREBL2 BINDING SITE, designated SEQ ID:817, to the nucleotide sequence of VGAM294 RNA,

herein designated VGAM RNA, also designated SEQ ID:629.

[8697] Another function of VGAM294 is therefore inhibition of CAMP Responsive Element Binding Protein-like 2 (CREBL2, Accession NM_001310). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CREBL2. Glucosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490) is another VGAM294 host target gene. GCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT1 BINDING SITE, designated SEQ ID:830, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:629.

[8698] Another function of VGAM294 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 1, Core 2 (beta-1,6-N-acetylglucosaminyltransferase) (GCNT1, Accession NM_001490), a gene which forms critical

branches in o-glycans. Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT1. The function of GCNT1 has been established by previous studies. Bierhuizen et al. (1993) provided the sequence of the developmental I antigen encoded by the cDNA for a member of a beta-1,6-N-acetylglucosaminyltransferase gene family. By Northern blot analysis, Yeh et al. (1999) showed that multiple transcripts of GCNT1 were expressed in nearly all tissues tested, whereas expression of GCNT3 (OMIM Ref. No. 606836) was more restricted. Transcripts were also readily detected in some leukemic cell lines and in colon and cervical carcinoma cell lines, but not in a lung carcinoma cell line.

[8699] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8700] Bierhuizen, M. F. A.; Mattei, M.-G.; Fukuda, M. : Expression of the developmental I antigen by a cloned human cDNA encoding a member of a beta-1,6-N-acetylglucosaminyltransferase gene family. *Genes Dev.* 7: 468-478, 1993. ; and

[8701] Pilz, A.; Woodward, K.; Povey, S.; Abbott, C. : Comparative

mapping of 50 human chromosome 9 loci in the laboratory mouse. Genomics 25: 139–149, 1995.

[8702] Further studies establishing the function and utilities of GCNT1 are found in John Hopkins OMIM database record ID 600391, and in cited publications numbered 282 and 2831 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM294 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:1938, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:629.

[8703] Another function of VGAM294 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL.

The function of MBNL and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM196.AFAP (Accession NM_021638) is another VGAM294 host target gene. AFAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AFAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AFAP BINDING SITE, designated SEQ ID:1952, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:629.

[8704] Another function of VGAM294 is therefore inhibition of AFAP (Accession NM_021638). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AFAP. LOC148195 (Accession XM_097419) is another VGAM294 host target gene. LOC148195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:1953, to the nucleotide sequence of VGAM RNA, herein designated VGAM RNA, also designated SEQ ID:629.

tarity of the nucleotide sequences of LOC148195 BINDING SITE, designated SEQ ID:3299, to the nucleotide sequence of VGAM294 RNA, herein designated VGAM RNA, also designated SEQ ID:629.

[8705] Another function of VGAM294 is therefore inhibition of LOC148195 (Accession XM_097419). Accordingly, utilities of VGAM294 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148195. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 295 (VGAM295) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8706] VGAM295 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM295 was detected is described hereinabove with reference to Figs. 1–8.

[8707] VGAM295 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[8708] VGAM295 gene encodes a VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM295 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM295 precursor RNA is designated SEQ ID:281, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:281 is located at position 172682 relative to the genome of Vaccinia Virus.

[8709] VGAM295 precursor RNA folds onto itself, forming VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8710] An enzyme complex designated DICER COMPLEX, `dices` the VGAM295 folded precursor RNA into VGAM295 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM295 RNA is designated SEQ ID:630, and is provided hereinbelow with reference to the sequence listing part.

[8711] VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM295 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8712] VGAM295 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM295 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM295 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8713] The complementary binding of VGAM295 RNA, herein designated VGAM RNA, to host target binding sites on VGAM295 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM295 host target RNA into VGAM295 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8714] It is appreciated that VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM295 host target genes. The mRNA of each one of this plurality of VGAM295 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM295 RNA, herein designated VGAM RNA, and which when bound by VGAM295 RNA causes inhibition of translation of respective one or more VGAM295 host target proteins.

[8715] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM295 gene, herein designated VGAM GENE, on one or more VGAM295 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8716] It is yet further appreciated that a function of VGAM295 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM295 correlate with, and may be deduced from, the identity of the host target genes which VGAM295 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8717] Nucleotide sequences of the VGAM295 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM295 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM295 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM295 are further described hereinbelow with reference to Table 1.

[8718] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM295 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM295 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8719] As mentioned hereinabove with reference to Fig. 1, a function of VGAM295 gene, herein designated VGAM is inhibition of expression of VGAM295 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM295 correlate with, and may be deduced from, the identity of the target genes which VGAM295 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8720] ATPase, H⁺ Transporting, Lysosomal 70kDa, V1 Subunit A, Isoform 1 (ATP6V1A1, Accession NM_001690) is a VGAM295 host target gene. ATP6V1A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1A1 BINDING SITE, designated SEQ ID:847, to the nucleotide sequence of VGAM295 RNA, herein designated

VGAM RNA, also designated SEQ ID:630.

[8721] A function of VGAM295 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal 70kDa, V1 Subunit A, Iso-form 1 (ATP6V1A1, Accession NM_001690), a gene which is responsible for acidifying a variety of intracellular compartments in eukaryotic cells. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1A1. The function of ATP6V1A1 has been established by previous studies. Van Hille et al. (1993) cloned a partial cDNA clone for an A subunit isoform, which they designated VA68, from a human osteoclastoma tumor cDNA library by PCR using degenerate primers based on the bovine sequence. They obtained a full-length clone from a genomic library. The deduced 617-amino acid protein has a predicted molecular mass of about 68 kD and shows 99% sequence identity with the bovine brain subunit A. Northern blot analysis revealed ubiquitous expression of a major 4.8-kb band and a minor 3.4-kb band. They also identified a variant, which they designated HO68, encoding a 615-amino acid protein. By RNase protection assays and in situ hybridization, van Hille et al. (1995) determined that expression of the HO68

variant was specific to the osteoclastoma originally used to construct the cDNA library.

[8722] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8723] van Hille, B.; Richener, H.; Evans, D. B.; Green, J. R.; Bilbe, G. : Identification of two subunit A isoforms of the vacuolar H(+)-ATPase in human osteoclastoma. J. Biol. Chem. 268: 7075-7080, 1993. ; and

[8724] van Hille, B.; Richener, H.; Green, J. R.; Bilbe, G. : The ubiquitous VA68 isoform of subunit A of the vacuolar H(+)-ATPase is highly expressed in human osteoclasts. Biochem. Biophys.

[8725] Further studies establishing the function and utilities of ATP6V1A1 are found in John Hopkins OMIM database record ID 607027, and in cited publications numbered 1226-1227 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Death-associated Protein (DAP, Accession XM_051902) is another VGAM295 host target gene. DAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAP, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAP BINDING SITE, designated SEQ ID:2954, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8726] Another function of VGAM295 is therefore inhibition of Death-associated Protein (DAP, Accession XM_051902), a gene which mediates in programmed cell death . Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAP. The function of DAP has been established by previous studies. Deiss et al. (1995) reported that gamma-interferon (OMIM Ref. No. 147570) induced in HeLa cells a type of death that had cytologic characteristics of programmed cell death. In this system, they identified 2 novel genes whose expression was indispensable for the execution of this type of cell death. The rescue was based on positive growth selection of cells after transfection with antisense cDNA expression libraries. The antisense RNA-mediated inactivation of the 2 novel genes protected the cells from the IFNG-induced cell death, but not from the cytostatic effects of the cytokine or from a necrotic type of cell death. One of these genes was death-

associated protein kinase-1 (OMIM Ref. No. 600831). The other, designated death-associated protein (DAP), was expressed as a single 2.4-kb mRNA that encodes a basic, proline-rich, 15-kD protein. The expression levels of the 2 proteins were selectively reduced by the corresponding antisense RNAs. The authors suggested that these 2 novel genes are candidates for positive mediators of programmed cell death that is induced by interferon-gamma. By analysis of rodent-human somatic cell hybrids, Feinstein et al. (1995) found that DAP is located on chromosome 5p15.2 in a region just centromeric to that to which the cri-du-chat syndrome (OMIM Ref. No. 123450) has been mapped

[8727] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8728] Deiss, L. P.; Feinstein, E.; Berissi, H.; Cohen, O.; Kimchi, A. : Identification of a novel serine/threonine kinase and a novel 15-kD protein as potential mediators of the gamma interferon-induced cell death. *Genes Dev.* 9: 15-30, 1995. ; and

[8729] Feinstein, E.; Druck, T.; Kastury, K.; Berissi, H.; Goodart, S. A.; Overhauser, J.; Kimchi, A.; Huebner, K. : Assignment of

DAP1 and DAPK: genes that positively mediate programmed cell.

[8730] Further studies establishing the function and utilities of DAP are found in John Hopkins OMIM database record ID 600954, and in cited publications numbered 1877–1878 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310) is another VGAM295 host target gene. LIFR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LIFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIFR BINDING SITE, designated SEQ ID:919, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8731] Another function of VGAM295 is therefore inhibition of Leukemia Inhibitory Factor Receptor (LIFR, Accession NM_002310). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIFR. Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Acces-

sion NM_021111) is another VGAM295 host target gene. RECK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RECK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECK BINDING SITE, designated SEQ ID:1941, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8732] Another function of VGAM295 is therefore inhibition of Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Accession NM_021111), a gene which plays a role in regulation of cancer progression and tumor angiogenesis. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECK. The function of RECK has been established by previous studies. Transformed malignant cell lines frequently lose a flat morphology and acquire a round morphology. Genes that induce flat reversion may be useful in the control of cancer. By screening a fibroblast expression library for reversion-inducing cDNAs, Takahashi et al. (1998) isolated a cDNA encoding RECK (reversion-inducing, cysteine-rich protein with Kazal

motifs). Sequence analysis predicted that the 971–amino acid RECK protein, which shares 93% amino acid identity with mouse Reck, is 9% cysteine and contains an N–terminal signal sequence; 5 putative cysteine knot motifs; 5 potential N–glycosylation sites; 3 central serine protease inhibitor domains with either complete or incomplete Kazal–type, 4–cys motifs; 2 regions with weak homology to EGF–like repeats; and a C–terminal hydrophobic glycosylphosphatidylinositol–anchoring signal. Immunoblot analysis showed that RECK is expressed as a 110–kD protein that is reduced to approximately 100 kD after deglycosylation. Northern blot analysis detected a 4.6–kb RECK transcript in a wide variety of tissues and normal cell lines, but no expression was detected in tumor cell lines. Restoration of RECK expression in tumor cell lines did not affect growth but did significantly suppress matrix invasion and metastatic activity. SDS–PAGE and gelatin zymography analysis demonstrated that due to a posttranscriptional event(s), secretion of MMP9 (OMIM Ref. No. 120361), a key enzyme in tumor invasion and metastasis, is decreased in cells expressing RECK. An RECK mutant lacking the C–terminal 23 residues retained the ability to suppress tumor cell invasion and MMP9 proteolytic activity

but lost the ability to inhibit MMP9 release. Animal model experiments lend further support to the function of RECK. Oh et al. (2001) showed that in addition to MMP9, RECK also regulates MMP2 (OMIM Ref. No. 120360) and MT1-MMP (MMP14; 600754), which are known to be involved in cancer progression. Mice lacking a functional Reck gene died around embryonic day 10.5 with defects in collagen fibrils, the basal lamina, and vascular development; this phenotype could be partially suppressed by Mmp2 null mutation. Vascular sprouting was dramatically suppressed in tumors derived from Reck-expressing fibrosarcoma cells grown in nude mice. These results supported a role for RECK in the regulation of MMP2 in vivo and implicated RECK downregulation in tumor angiogenesis.

[8733] It is appreciated that the abovementioned animal model for RECK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8734] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8735] Takahashi, C.; Sheng, Z.; Horan, T. P.; Kitayama, H.; Maki,

Yoshida, H.

[8737] Further studies establishing the function and utilities of
RECK are found in John Hopkins OMIM database record ID
605227, and in cited publications numbered 1654-1655
listed in the bibliography section hereinbelow, which are
also hereby incorporated by reference. Solute Carrier Fam-
ily 13 (sodium-dependent dicarboxylate transporter),
Member 3 (SLC13A3, Accession XM_017841) is another
VGAM295 host target gene. SLC13A3 BINDING SITE is
HOST TARGET binding site found in the 3' untranslated
region of mRNA encoded by SLC13A3, corresponding to a
HOST TARGET binding site such as BINDING SITE I, BIND-
ING SITE II or BINDING SITE III. Table 2 illustrates the com-
plementarity of the nucleotide sequences of SLC13A3

BINDING SITE, designated SEQ ID:2570, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8738] Another function of VGAM295 is therefore inhibition of Solute Carrier Family 13 (sodium-dependent dicarboxylate transporter), Member 3 (SLC13A3, Accession XM_017841). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC13A3. TEM8 (Accession NM_032208) is another VGAM295 host target gene. TEM8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TEM8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM8 BINDING SITE, designated SEQ ID:2236, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8739] Another function of VGAM295 is therefore inhibition of TEM8 (Accession NM_032208), a gene which is a tumor-specific endothelial marker. Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM8. The

function of TEM8 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM135.DKFZp547I224 (Accession NM_020221) is another VGAM295 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:1903, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8740] Another function of VGAM295 is therefore inhibition of DKFZp547I224 (Accession NM_020221). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. Olfactomedin 3 (OLFM3, Accession XM_088951) is another VGAM295 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:3232, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8741] Another function of VGAM295 is therefore inhibition of Olfactomedin 3 (OLFM3, Accession XM_088951). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. TSARG1 (Accession NM_139073) is another VGAM295 host target gene. TSARG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSARG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSARG1 BINDING SITE, designated SEQ ID:2470, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8742] Another function of VGAM295 is therefore inhibition of TSARG1 (Accession NM_139073). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TSARG1. LOC114987 (Accession NM_145241) is another VGAM295 host target gene. LOC114987 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114987, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114987 BINDING SITE, designated SEQ ID:2517, to the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8743] Another function of VGAM295 is therefore inhibition of LOC114987 (Accession NM_145241). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114987. LOC152445 (Accession XM_098231) is another VGAM295 host target gene. LOC152445 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152445, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152445 BINDING SITE, designated SEQ ID:3360, to

the nucleotide sequence of VGAM295 RNA, herein designated VGAM RNA, also designated SEQ ID:630.

[8744] Another function of VGAM295 is therefore inhibition of LOC152445 (Accession XM_098231). Accordingly, utilities of VGAM295 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152445. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 296 (VGAM296) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8745] VGAM296 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM296 was detected is described hereinabove with reference to Figs. 1–8.

[8746] VGAM296 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8747] VGAM296 gene encodes a VGAM296 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM296 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM296 precursor RNA is designated SEQ ID:282, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:282 is located at position 169865 relative to the genome of Vaccinia Virus.

[8748] VGAM296 precursor RNA folds onto itself, forming VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8749] An enzyme complex designated DICER COMPLEX, `dices` the VGAM296 folded precursor RNA into VGAM296 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM296 RNA is designated SEQ ID:631, and is provided hereinbelow with reference to the sequence listing part.

[8750] VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM296 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[8751] VGAM296 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM296 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM296 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8752] The complementary binding of VGAM296 RNA, herein designated VGAM RNA, to host target binding sites on VGAM296 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM296 host target RNA into VGAM296 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8753] It is appreciated that VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM296 host target genes. The mRNA of each one of this plurality of VGAM296 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM296 RNA, herein designated VGAM RNA, and which when bound by VGAM296 RNA causes inhibition of translation of respective one or more VGAM296 host target proteins.

[8754] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM296 gene, herein designated VGAM GENE, on one or more VGAM296 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[8755] It is yet further appreciated that a function of VGAM296 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM296 correlate with, and may be deduced from, the identity of the host target genes which VGAM296 binds and inhibits, and the function of these host target genes, as elaborated herein—below.

[8756] Nucleotide sequences of the VGAM296 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM296 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM296 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM296 are further described hereinbelow with reference to Table 1.

[8757] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM296 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM296 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8758] As mentioned hereinabove with reference to Fig. 1, a function of VGAM296 gene, herein designated VGAM is inhibition of expression of VGAM296 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM296 correlate with, and may be deduced from, the identity of the target genes which VGAM296 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8759] FLJ20139 (Accession NM_017685) is a VGAM296 host target gene. FLJ20139 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20139, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20139 BINDING SITE, designated SEQ ID:1737, to the nucleotide sequence of VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:631.

[8760] A function of VGAM296 is therefore inhibition of FLJ20139 (Accession NM_017685). Accordingly, utilities of

VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20139. LOC91796 (Accession XM_040743) is another VGAM296 host target gene. LOC91796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91796, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91796 BINDING SITE, designated SEQ ID:2785, to the nucleotide sequence of VGAM296 RNA, herein designated VGAM RNA, also designated SEQ ID:631.

[8761] Another function of VGAM296 is therefore inhibition of LOC91796 (Accession XM_040743). Accordingly, utilities of VGAM296 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91796. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 297 (VGAM297) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8762] VGAM297 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM297 was detected is described hereinabove with reference to Figs. 1–8.

[8763] VGAM297 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8764] VGAM297 gene encodes a VGAM297 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM297 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM297 precursor RNA is designated SEQ ID:283, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:283 is located at position 170506 relative to the genome of Vaccinia Virus.

[8765] VGAM297 precursor RNA folds onto itself, forming VGAM297 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8766] An enzyme complex designated DICER COMPLEX, `dices` the VGAM297 folded precursor RNA into VGAM297 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 77%) nucleotide sequence of VGAM297 RNA is designated SEQ ID:632, and is provided hereinbelow with reference to the sequence listing part.

[8767] VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM297 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[8768] VGAM297 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM297 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM297 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8769] The complementary binding of VGAM297 RNA, herein designated VGAM RNA, to host target binding sites on VGAM297 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM297 host target RNA into VGAM297 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8770] It is appreciated that VGAM297 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM297 host target genes. The mRNA of each one of this plurality of VGAM297 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM297 RNA, herein designated VGAM RNA, and which when bound by VGAM297 RNA causes inhibition of translation of respective one or more VGAM297 host target proteins.

[8771] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM297 gene, herein designated VGAM GENE, on one or more VGAM297 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8772] It is yet further appreciated that a function of VGAM297 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM297 correlate with, and may be deduced from, the identity of the host target genes which VGAM297 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8773] Nucleotide sequences of the VGAM297 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM297 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM297 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM297 are further
described hereinbelow with reference to Table 1.

[8774] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM297 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM297 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8775] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM297 gene, herein designated VGAM is
inhibition of expression of VGAM297 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM297 correlate with, and may be deduced
from, the identity of the target genes which VGAM297
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[8776] Cell Matrix Adhesion Regulator (CMAR, Accession
NM_005200) is a VGAM297 host target gene. CMAR BIND-

ING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CMAR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMAR BINDING SITE, designated SEQ ID:1194, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8777] A function of VGAM297 is therefore inhibition of Cell Matrix Adhesion Regulator (CMAR, Accession NM_005200). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMAR. Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382) is another VGAM297 host target gene. CRHR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CRHR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRHR1 BINDING SITE, designated SEQ ID:1105, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8778] Another function of VGAM297 is therefore inhibition of Corticotropin Releasing Hormone Receptor 1 (CRHR1, Accession NM_004382), a gene which likely mediates physiological and behavioral response to stress. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRHR1. The function of CRHR1 has been established by previous studies. Grammatopoulos et al. (1998) studied the expression of CRHR1 in human myometrium. They used RT-PCR, fluorescence in situ hybridization, and immunofluorescence to identify and localize the 4 subtypes, 1-alpha, 1-beta, 2-alpha, and the variant C, of CRHR1. The CRHR1 subtypes in myometrium exhibited differential expression patterns; in human pregnant myometrium at term, all 4 receptor subtypes were expressed, whereas only the 1-alpha and 1-beta receptor subtypes were found in the nonpregnant myometrium. The authors concluded that CRHR1 acting via different receptor subtypes is able to exert different actions on the myometrium in the pregnant state compared to the nonpregnant state. Furthermore, in the pregnant human uterus, receptors were localized in both smooth muscle and fibroblasts, suggesting that CRHR1 expression plays an important

modulatory role in myometrial and possibly in cervical function Leproult et al. (2001) examined the effects of bright light on the profiles of hormones known to be affected by sleep deprivation (TSH; OMIM Ref. No. 188540) or involved in behavioral activation (cortisol). The early morning transition from dim to bright light suppressed melatonin secretion, induced an immediate, greater than 50% elevation of cortisol levels, and limited the deterioration of alertness normally associated with overnight sleep deprivation. No effect was detected on TSH profiles. The authors concluded that these data unambiguously demonstrate an effect of light on the corticotropic axis that is dependent on time of day Animal model experiments lend further support to the function of CRHR1. Sillaber et al. (2002) studied *Crhr1* $-/-$ mice generated by Timpl et al. (1998). In homozygous mutant mice, stress leads to enhanced and progressively increasing alcohol intake. The effect of repeated stress on alcohol drinking behavior appeared with a delay and persisted throughout life. It was associated with an upregulation of the N-methyl-D-aspartate receptor subunit NR2B (OMIM Ref. No. 138252). Sillaber et al. (2002) concluded that alterations in the CRHR1 gene and adaptional changes in NR2B

subunits may constitute a genetic risk factor for stress-induced alcohol drinking and alcoholism

[8779] It is appreciated that the abovementioned animal model for CRHR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8780] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8781] Leproult, R.; Colecchia, E. F.; L'Hermite-Baleriaux, M.; Van Cauter, E. : Transition from dim to bright light in the morning induces an immediate elevation of cortisol levels. J. Clin. Endocr. Metab. 86: 151–157, 2001. ; and

[8782] Sillaber, I.; Rammes, G.; Zimmermann, S.; Mahal, B.; Ziegler, W.; Wurst, W.; Holsboer, F.; Spanagel, R. : Enhanced and delayed stress-induced alcohol drinking in mice lacking fu.

[8783] Further studies establishing the function and utilities of CRHR1 are found in John Hopkins OMIM database record ID 122561, and in cited publications numbered 457–44 and 611–615 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Diphtheria Toxin Receptor (heparin-binding epider-

mal growth factor-like growth factor) (DTR, Accession NM_001945) is another VGAM297 host target gene. DTR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DTR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTR BINDING SITE, designated SEQ ID:874, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8784] Another function of VGAM297 is therefore inhibition of Diphtheria Toxin Receptor (heparin-binding epidermal growth factor-like growth factor) (DTR, Accession NM_001945), a gene which may be involved in macrophage-mediated cellular proliferation. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DTR. The function of DTR has been established by previous studies. Mouse cells are naturally resistant to diphtheria toxin because they lack functional cell surface receptors for the toxin. Naglich et al. (1992) isolated a monkey cDNA encoding the diphtheria toxin sensitivity determinant by expression cloning in mouse L-M cells.

Unlike wildtype L–M cells, transfected mouse cells were extremely toxin sensitive and specifically bound radioiodinated diphtheria toxin. Intoxication of the transfected cells required receptor–mediated endocytosis of the bound toxin. The cDNA was predicted to encode an integral membrane protein that is identical to the precursor of a heparin–binding EGF–like growth factor (7,8:Higashiyama et al., 1991, 1992). Thus the DT sensitivity protein is a growth factor precursor that the toxin exploits as a receptor. Fen et al. (1993) demonstrated that the heparin–binding EGF–like growth factor is encoded by a gene containing 6 exons and 5 intervening sequences spanning 14 kb of DNA. They demonstrated that treatment of endothelial cells with tumor necrosis factor–alpha (TNFA; 191160) produced a 10–fold increase in HB–EGF mRNA. By analysis of DNA isolated from human–mouse somatic hybrid cell lines, they assigned the gene to chromosome 5, thus confirming the assignment of the gene on the basis of its role in relation to diphtheria toxin susceptibility. The products of 5 distinct loci, EGF (OMIM Ref. No. 131530), TGFA (OMIM Ref. No. 190170), AREG (OMIM Ref. No. 104640), BCT (OMIM Ref. No. 600345), and HEGFL act as ligands for the epidermal growth factor re–

ceptor.

- [8785] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8786] Fen, Z.; Dhadly, M. S.; Yoshizumi, M.; Hilkert, R. J.; Quert-ermous, T.; Eddy, R. L.; Shows, T. B.; Lee, M.-E. : Structural organization and chromosomal assignment of the gene encoding the human heparin-binding epidermal growth factor-like growth factor/diphtheria toxin receptor. *Biochemistry* 32: 7932-7938, 1993. ; and
- [8787] Naglich, J. G.; Metherall, J. E.; Russell, D. W.; Eidels, L. : Expression cloning of a diphtheria toxin receptor: identity with a heparin-binding EGF-like growth factor precursor. *Cell*.
- [8788] Further studies establishing the function and utilities of DTR are found in John Hopkins OMIM database record ID 126150, and in cited publications numbered 950-95 and 52-57 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor 5 (FGF5, Accession NM_004464) is another VGAM297 host target gene. FGF5 BINDING SITE1 and FGF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA en-

coded by FGF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF5 BINDING SITE1 and FGF5 BINDING SITE2, designated SEQ ID:1117 and SEQ ID:2315 respectively, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8789] Another function of VGAM297 is therefore inhibition of Fibroblast Growth Factor 5 (FGF5, Accession NM_004464), a gene which induces transformation and may regulate neuronal differentiation. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF5. The function of FGF5 has been established by previous studies. Zhan et al. (1988) identified a fifth oncogene related to fibroblast growth factors and termed it FGF5. The other four are FGFA (OMIM Ref. No. 131220), FGFB (OMIM Ref. No. 134920), INT2 (OMIM Ref. No. 164950), and HST (OMIM Ref. No. 164980). FGF5 was discovered when it acquired transforming potential by a DNA rearrangement accompanying transfection of NIH 3T3 cells with human tumor DNA. Two regions of the FGF5 sequence, containing 122

of its 267 amino acid residues, were 40 to 50% homologous to the sequences of the 4 other members of the FGF oncogene family. FGF5, furthermore, was found to have a 3-exon structure typical for members of this family. FGF5 was found to be expressed in neonatal brain and in 3 of 13 human tumor cell lines examined. Nguyen et al. (1988) mapped FGF5 to 4q21 by in situ hybridization. Thus, it is not in the same cluster as the related HST and INT2 genes, which are coamplified in some tumor cells and were found by Nguyen et al. (1988), using pulsed field gel analysis, to be separated by only 40 kb. By polymerase chain reaction (PCR) amplification of target sequences in DNAs from somatic cell hybrids, Dionne et al. (1990) mapped the FGF5 gene to chromosome 4. By in situ chromosomal hybridization, Mattei et al. (1992) demonstrated that the corresponding gene in the mouse is on chromosome 5. Hebert et al. (1994) found that mice homozygous for a null allele of the *Fgf5* gene, produced by gene targeting in embryonic stem cells, have abnormally long hair. This phenotype appeared identical to that of mice homozygous for the spontaneous mutation 'angora' (*go*). The transgenic mutant and the '*go*' mutant failed to complement one another, and exon 1 of *Fgf5* was found to be deleted

in DNA from homozygotes. Expression of Fgf5 is detected in hair follicles from wildtype mice and is localized to the outer root sheath during the anagen VI phase of the hair growth cycle. The findings were interpreted as evidence that FGF5 functions as an inhibitor of hair elongation, thus identifying a molecule whose normal function is apparently to regulate one step in the progression of the follicle through the hair growth cycle. It will be of interest to search for mutations in the FGF5 gene in hypertrichosis universalis (145700, 145701) as well as in other forms of hypertrichosis such as hairy elbows (OMIM Ref. No. 139600).

[8790] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8791] Zhan, X.; Bates, B.; Hu, X.; Goldfarb, M. : The human FGF-5 oncogene encodes a novel protein related to fibroblast growth factors. *Molec. Cell. Biol.* 8: 3487-3495, 1988. ; and

[8792] Hebert, J. M.; Rosenquist, T.; Gotz, J.; Martin, G. R. : FGF5 as a regulator of the hair growth cycle: evidence from targeted and spontaneous mutations. *Cell* 78: 1017-1025, 1994.

[8793] Further studies establishing the function and utilities of FGF5 are found in John Hopkins OMIM database record ID 165190, and in cited publications numbered 146–147, 4 and 148–149 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein-like 1 (GNL1, Accession XM_166361) is another VGAM297 host target gene. GNL1 BINDING SITE1 and GNL1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GNL1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNL1 BINDING SITE1 and GNL1 BINDING SITE2, designated SEQ ID:3550 and SEQ ID:3748 respectively, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8794] Another function of VGAM297 is therefore inhibition of Guanine Nucleotide Binding Protein-like 1 (GNL1, Accession XM_166361). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNL1. Lactate Dehydrogenase B (LDHB, Accession NM_002300) is another

VGAM297 host target gene. LDHB BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LDHB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LDHB BINDING SITE, designated SEQ ID:918, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8795] Another function of VGAM297 is therefore inhibition of Lactate Dehydrogenase B (LDHB, Accession NM_002300), a gene which causes dehydrogenation of lactate. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LDHB. The function of LDHB has been established by previous studies. LDHB and peptidase B (OMIM Ref. No. 169900) are linked (Santachiara et al., 1970) and both loci are on chromosome 12 (Chen et al., 1973). Kitamura et al. (1971) reported the first case of a complete deficiency of lactate dehydrogenase subunit H(B) in serum, saliva and erythrocytes of a 64-year-old male with mild diabetes. Study made on family members revealed low LDH activity in their serum also linked with decreased

relative activity of the H4(B4) fraction. Based on the comparison of the calculated ratio of H to M subunits in normal and affected family members, it was hypothesized that the proband is homozygous while the abnormal family members are heterozygous, assuming a single gene is involved. Red cell metabolism in the proband was studied by Miwa et al. (1971); neither reticulocytosis nor hemolytic anemia was present. Thus, although LDHA deficiency leads to myoglobinuria and risk of renal failure after strenuous exercise, LDHB deficiency probably has no clear symptomatic consequences. As pointed out by Sudo (1993), LDH deficiency is of interest to laboratory medicine mainly because it can cause misdiagnosis in those disorders in which elevation of serum LDH is expected. LDH deficiency can probably be considered a 'nondisease.' In a screening of 2,880 blood samples from healthy persons in the Fukuoka Prefecture in Japan, Maekawa et al. (1994) found that the frequency of heterozygotes for either LDHA or LDHB deficiency was 0.104% at each locus. These estimated frequencies were slightly lower than, but not significantly different from, those found previously in the Shizuoka Prefecture. In a case of deletion of the short arm of chromosome 12,

Weiss et al. (1973) found evidence that LDHB is located there. From study of somatic cell hybrids Hamerton et al. (1975) concluded that LDHB is in the 12q21-pter region. Rethore et al. (1975) found augmentation of LDHB activity in a boy trisomic for the short arm of chromosome 12. From study of 3 patients with different deletions of chromosome 12, Rethore et al. (1976) concluded that the G3PD locus is on the distal part of 12p, between p12.2 and 12pter, and that the LDHB locus is on the middle third between 12p12.1 and 12p12.2. The results for TPI were similar to those for G3PD, suggesting the same distal localization. Mohrenweiser and Neel (1981) identified thermostable variants of lactate dehydrogenase B, glucosephosphate isomerase, and glucose-6-phosphate dehydrogenase. None was detectable as a variant by standard electrophoretic techniques. All were inherited. Steinbach and Rehder (1987) demonstrated dosage effect with LDHB in a case of tetrasomy of 12p. Sakai et al. (1987) isolated and sequenced LDHB cDNA. Nucleotide and amino acid sequences showed 68% and 75% identity, respectively, with those of LDHA. Sudo et al. (1990) demonstrated 93% homology between an LDHB processed pseudogene and the functional gene. The pseudogene was

mapped to the X chromosome by dot blot analysis.

[8796] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8797] Kitamura, M.; Iijima, N.; Hashimoto, F.; Hiratsuka, A. : Hereditary deficiency of subunit H of lactate dehydrogenase. Clin. Chim. Acta 34: 419–423, 1971. ; and

[8798] Sudo, K.; Maekawa, M.; Luedemann, M. M.; Deaven, L. L.; Li, S. S.–L. : Human lactate dehydrogenase–B processed pseudogene: nucleotide sequence analysis and assignment to the X–chromosom.

[8799] Further studies establishing the function and utilities of LDHB are found in John Hopkins OMIM database record ID 150100, and in cited publications numbered 1155, 2572–258 and 2592–2604 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM_000428) is another VGAM297 host target gene. LTBP2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LTBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen–

tarity of the nucleotide sequences of LTBP2 BINDING SITE, designated SEQ ID:740, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8800] Another function of VGAM297 is therefore inhibition of Latent Transforming Growth Factor Beta Binding Protein 2 (LTBP2, Accession NM_000428), a gene which targets latent TGF-beta to the extracellular matrix. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBP2. The function of LTBP2 has been established by previous studies. Transforming growth factors (TGFs) beta-1 (OMIM Ref. No. 190180), beta-2 (OMIM Ref. No. 190220), beta-3 (OMIM Ref. No. 190230), and others have both stimulatory and inhibitory effects on the growth of different cell types and play a role in the production and degradation of the extracellular matrix. TGF-beta molecules are secreted in the form of latent large molecular mass complexes that contain other proteins, such as latent TGF-beta-1 binding protein (LTBP1; 150390). There is evidence that these binding proteins modulate TGF-beta bioavailability. Animal model experiments lend further support to the function of LTBP2. Dabovic et al.

(2002) created an *Ltbp3*-null mutation in the mouse by gene targeting. Mice homozygous for the mutation developed craniofacial malformations by day 10. At 2 months, there was a pronounced rounding of the cranial vault, extension of the mandible beyond the maxilla, and kyphosis. Between 6 and 9 months of age, mutant mice also developed osteosclerosis and osteoarthritis. The pathologic changes were consistent with perturbed TGF-beta signaling in the skull and long bones

[8801] It is appreciated that the abovementioned animal model for LTBP2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8802] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8803] Oklu, R.; Hesketh, R. : The latent transforming growth factor beta binding protein (LTBP) family. *Biochem. J.* 352: 601-610, 2000. ; and

[8804] Dabovic, B.; Chen, Y.; Colarossi, C.; Obata, H.; Zambuto, L.; Perle, M. A.; Rifkin, D. B. : Bone abnormalities in latent TGF-beta binding protein (*Ltbp*)-3-null mice indicate a role for *Ltb*.

[8805] Further studies establishing the function and utilities of LTBP2 are found in John Hopkins OMIM database record ID 602090, and in cited publications numbered 1478–147 and 3009–1481 listed in the bibliography section herein–below, which are also hereby incorporated by reference. MAP/microtubule Affinity–regulating Kinase 1 (MARK1, Accession NM_018650) is another VGAM297 host target gene. MARK1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MARK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MARK1 BINDING SITE, designated SEQ ID:1856, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8806] Another function of VGAM297 is therefore inhibition of MAP/microtubule Affinity–regulating Kinase 1 (MARK1, Accession NM_018650), a gene which phosphorylate microtubule–associated proteins and trigger microtubule disruption. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MARK1. The function of MARK1

and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM38. Plasminogen Activator, Tissue (PLAT, Accession NM_033011) is another VGAM297 host target gene. PLAT BINDING SITE1 and PLAT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLAT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAT BINDING SITE1 and PLAT BINDING SITE2, designated SEQ ID:2306 and SEQ ID:788 respectively, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8807] Another function of VGAM297 is therefore inhibition of Plasminogen Activator, Tissue (PLAT, Accession NM_033011). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAT. Paxillin (PXN, Accession NM_002859) is another VGAM297 host target gene. PXN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXN, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXN BINDING SITE, designated SEQ ID:965, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8808] Another function of VGAM297 is therefore inhibition of Paxillin (PXN, Accession NM_002859), a gene which interacts with multiple structural and signalling proteins. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXN. The function of PXN has been established by previous studies. Glenney and Zokas (1989) used an antiphosphotyrosine antibody to identify proteins that are phosphorylated in Rous sarcoma virus-transformed chick embryo fibroblasts, and found a 76-kD protein that localizes to focal adhesions at the ends of actin-containing stress fibers in nontransformed cells. Turner et al. (1990) purified this protein from chicken gizzard smooth muscle, and named it paxillin ('paxillus' means 'small stake' or 'peg' in Latin) as a protein tethered to the membrane at focal adhesions. Paxillin migrates as a diffuse 65- to 70-kD band on SDS-PAGE. Salgia et al.

(1995) stated that transmembrane integrin molecules (see OMIM Ref. No. 600536) connect the actin cytoskeleton to the extracellular matrix within focal adhesions. They cloned human paxillin by screening an expression library with antipaxillin antibody. The predicted 557–amino acid protein has a predicted molecular mass of 61 kD, but an observed molecular mass of 68 kD, suggesting that it is either posttranslationally modified or migrates aberrantly due to high (10%) proline content. The paxillin protein contains 4 LIM domains, a proline–rich domain containing a consensus SH3–binding site, and 3 potential SH2–binding sites. On Northern blots, paxillin was expressed as a 3.7–kb mRNA in all tissues tested. Mazaki et al. (1997) found that the paxillin gene can be alternatively spliced to include 1 of 2 alternative exons, generating beta and gamma isoforms. As observed on Northern blots, Western blots, and with RT–PCR, the beta and gamma isoforms are expressed only in certain cancer cell lines. The different isoforms had different affinities for cellular proteins, including vinculin (OMIM Ref. No. 193065) and FAK (OMIM Ref. No. 600758), suggesting that each acts as a distinct module involved in different functions of integrins.

- [8809] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8810] Salgia, R.; Li, J.-L.; Lo, S. H.; Brunkhorst, B.; Kansas, G. S.; Sobhany, E. S.; Sun, Y.; Pisick, E.; Hallek, M.; Ernst, T.; Tantravahi, R.; Chen, L. B.; Griffin, J. D. : Molecular cloning of human paxillin, a focal adhesion protein phosphorylated by P210(BCR/ABL). J. Biol. Chem. 270: 5039–5047, 1995. ; and
- [8811] Mazaki, Y.; Hashimoto, S.; Sabe, H. : Monocyte cells and cancer cells express novel paxillin isoforms with different binding properties to focal adhesion proteins. J. Biol. Chem. 272: 74.
- [8812] Further studies establishing the function and utilities of PXN are found in John Hopkins OMIM database record ID 602505, and in cited publications numbered 2020–2024 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ribonuclease/angiogenin Inhibitor (RNH, Accession XM_006139) is another VGAM297 host target gene. RNH BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by RNH, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNH BINDING SITE, designated SEQ ID:2536, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8813] Another function of VGAM297 is therefore inhibition of Ribonuclease/angiogenin Inhibitor (RNH, Accession XM_006139), a gene which is an inhibitor of pancreatic rnaase and angiogenin. may also function in the modulation of cellular activities. Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNH. The function of RNH has been established by previous studies. Placental ribonuclease inhibitor is a member of a family of proteinaceous cytoplasmic RNase inhibitors that occur in many tissues and bind to both intracellular and extracellular RNases. In addition to control of intracellular RNases, the inhibitor may have a role in the regulation of angiogenin (OMIM Ref. No. 105850). Ribonuclease inhibitor, of 50,000 Da, binds to ribonucleases and holds them in a latent form. Since neutral and alkaline ribonucleases probably play a critical role in the turnover of RNA in eukaryotic cells, RNH may be essential for control of mRNA turnover;

the interaction of eukaryotic cells with ribonuclease may be reversible in vivo. Lee et al. (1988) determined the primary structure of PRI from the cDNA. The mature protein encodes a 460-amino acid polypeptide with a molecular mass of 49,847 kD. The amino acid sequence contains 7 direct internal repeat units, each 57 amino acids in length. These repeat units comprise 87% of the molecule. The average degree of identity between any 2 is 39%. By study of human-rodent somatic cell hybrids and by in situ hybridization, Weremowicz et al. (1990) mapped the PRI gene to 11p15. The localization was further refined to 11p15.5, distal to the IGF2 gene, by in situ hybridization to metaphase chromosomes from a cell line with a well-characterized translocation involving a breakpoint between IGF2 (OMIM Ref. No. 147470) and HRAS (OMIM Ref. No. 190020). Zneimer et al. (1990) localized the RNH gene to 11p15.5 by in situ hybridization

[8814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8815] Weremowicz, S.; Fox, E. A.; Morton, C. C.; Vallee, B. L. : The placental ribonuclease inhibitor (RNH) gene is located on chromosome subband 11p15.5. Genomics 8: 717-721,

1990. ; and

[8816] Zneimer, S. M.; Crawford, D.; Schneider, N. R.; Beutler, B. : Mapping of the human ribonuclease inhibitor gene (RNH) to chromosome 11p15 by in situ hybridization. Genomics 8: 175–178, 19.

[8817] Further studies establishing the function and utilities of RNH are found in John Hopkins OMIM database record ID 173320, and in cited publications numbered 2209–2211 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sodium Channel, Voltage-gated, Type IV, Alpha Polypeptide (SCN4A, Accession NM_000334) is another VGAM297 host target gene. SCN4A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SCN4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN4A BINDING SITE, designated SEQ ID:730, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8818] Another function of VGAM297 is therefore inhibition of Sodium Channel, Voltage-gated, Type IV, Alpha Polypep–

tide (SCN4A, Accession NM_000334). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN4A. SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025) is another VGAM297 host target gene. SH3GL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3GL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3GL1 BINDING SITE, designated SEQ ID:982, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8819] Another function of VGAM297 is therefore inhibition of SH3-domain GRB2-like 1 (SH3GL1, Accession NM_003025). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SH3GL1. Zinc Finger Protein 261 (ZNF261, Accession NM_005096) is another VGAM297 host target gene. ZNF261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF261, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF261 BINDING SITE, designated SEQ ID:1184, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8820] Another function of VGAM297 is therefore inhibition of Zinc Finger Protein 261 (ZNF261, Accession NM_005096). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF261. A Kinase (PRKA) Anchor Protein 3 (AKAP3, Accession NM_006422) is another VGAM297 host target gene. AKAP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP3 BINDING SITE, designated SEQ ID:1300, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8821] Another function of VGAM297 is therefore inhibition of A Kinase (PRKA) Anchor Protein 3 (AKAP3, Accession

NM_006422). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP3. C3F (Accession NM_005768) is another VGAM297 host target gene. C3F BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C3F, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C3F BINDING SITE, designated SEQ ID:1246, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8822] Another function of VGAM297 is therefore inhibition of C3F (Accession NM_005768). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C3F. CL24751 (Accession XM_035634) is another VGAM297 host target gene. CL24751 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CL24751, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CL24751 BINDING SITE,

designated SEQ ID:2698, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8823] Another function of VGAM297 is therefore inhibition of CL24751 (Accession XM_035634). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CL24751. DIS3 (Accession NM_014953) is another VGAM297 host target gene. DIS3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DIS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DIS3 BINDING SITE, designated SEQ ID:1597, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8824] Another function of VGAM297 is therefore inhibition of DIS3 (Accession NM_014953). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DIS3. FLJ10700 (Accession NM_018182) is another VGAM297 host target gene. FLJ10700 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ10700, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10700 BINDING SITE, designated SEQ ID:1794, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8825] Another function of VGAM297 is therefore inhibition of FLJ10700 (Accession NM_018182). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10700. FLJ13102 (Accession NM_024887) is another VGAM297 host target gene. FLJ13102 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13102, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13102 BINDING SITE, designated SEQ ID:2104, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8826] Another function of VGAM297 is therefore inhibition of FLJ13102 (Accession NM_024887). Accordingly, utilities of

VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13102. FLJ32978 (Accession NM_144625) is another VGAM297 host target gene. FLJ32978 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32978 BINDING SITE, designated SEQ ID:2488, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8827] Another function of VGAM297 is therefore inhibition of FLJ32978 (Accession NM_144625). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32978. Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424) is another VGAM297 host target gene. HSPB7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HSPB7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of HSPB7 BINDING SITE, designated SEQ ID:1499, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8828] Another function of VGAM297 is therefore inhibition of Heat Shock 27kDa Protein Family, Member 7 (cardiovascular) (HSPB7, Accession NM_014424). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPB7. HTCD37 (Accession XM_041884) is another VGAM297 host target gene. HTCD37 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTCD37, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTCD37 BINDING SITE, designated SEQ ID:2796, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8829] Another function of VGAM297 is therefore inhibition of HTCD37 (Accession XM_041884). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTCD37.

KIAA0280 (Accession XM_166238) is another VGAM297 host target gene. KIAA0280 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0280, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0280 BINDING SITE, designated SEQ ID:3537, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8830] Another function of VGAM297 is therefore inhibition of KIAA0280 (Accession XM_166238). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0280. KIAA0450 (Accession NM_014638) is another VGAM297 host target gene. KIAA0450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0450 BINDING SITE, designated SEQ ID:1511, to the nucleotide sequence of VGAM297 RNA, herein designated

VGAM RNA, also designated SEQ ID:632.

[8831] Another function of VGAM297 is therefore inhibition of KIAA0450 (Accession NM_014638). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0450. KIAA0731 (Accession XM_039975) is another VGAM297 host target gene. KIAA0731 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0731, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0731 BINDING SITE, designated SEQ ID:2767, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8832] Another function of VGAM297 is therefore inhibition of KIAA0731 (Accession XM_039975). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0731. KIAA1462 (Accession XM_166132) is another VGAM297 host target gene. KIAA1462 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1462, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1462 BINDING SITE, designated SEQ ID:3523, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8833] Another function of VGAM297 is therefore inhibition of KIAA1462 (Accession XM_166132). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1462. LIM Domain Kinase 2 (LIMK2, Accession NM_016733) is another VGAM297 host target gene. LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LIMK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LIMK2 BINDING SITE1 and LIMK2 BINDING SITE2, designated SEQ ID:1710 and SEQ ID:1225 respectively, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8834] Another function of VGAM297 is therefore inhibition of

LIM Domain Kinase 2 (LIMK2, Accession NM_016733). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LIMK2. MGC3101 (Accession NM_024043) is another VGAM297 host target gene. MGC3101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC3101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3101 BINDING SITE, designated SEQ ID:2046, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8835] Another function of VGAM297 is therefore inhibition of MGC3101 (Accession NM_024043). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3101. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM297 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:1307, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8836] Another function of VGAM297 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. RNA Binding Motif Protein 14 (RBM14, Accession NM_006328) is another VGAM297 host target gene. RBM14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RBM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM14 BINDING SITE, designated SEQ ID:1289, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8837] Another function of VGAM297 is therefore inhibition of RNA Binding Motif Protein 14 (RBM14, Accession NM_006328). Accordingly, utilities of VGAM297 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM14. SCYA5 (Accession NM_002985) is another VGAM297 host target gene.

SCYA5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCYA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCYA5 BINDING SITE, designated SEQ ID:979, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8838] Another function of VGAM297 is therefore inhibition of SCYA5 (Accession NM_002985). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCYA5. U5-116KD (Accession NM_004247) is another VGAM297 host target gene. U5-116KD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by U5-116KD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of U5-116KD BINDING SITE, designated SEQ ID:1095, to the nucleotide sequence

of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8839] Another function of VGAM297 is therefore inhibition of U5-116KD (Accession NM_004247). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with U5-116KD. WSB1 (Accession NM_134264) is another VGAM297 host target gene. WSB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WSB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WSB1 BINDING SITE, designated SEQ ID:2429, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8840] Another function of VGAM297 is therefore inhibition of WSB1 (Accession NM_134264). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WSB1. LOC144501 (Accession XM_096612) is another VGAM297 host target gene. LOC144501 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC144501, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144501 BINDING SITE, designated SEQ ID:3268, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8841] Another function of VGAM297 is therefore inhibition of LOC144501 (Accession XM_096612). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144501. LOC146940 (Accession XM_085648) is another VGAM297 host target gene. LOC146940 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146940, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146940 BINDING SITE, designated SEQ ID:3101, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8842] Another function of VGAM297 is therefore inhibition of LOC146940 (Accession XM_085648). Accordingly, utilities

of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146940. LOC197003 (Accession XM_113798) is another VGAM297 host target gene. LOC197003 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197003, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197003 BINDING SITE, designated SEQ ID:3418, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8843] Another function of VGAM297 is therefore inhibition of LOC197003 (Accession XM_113798). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197003. LOC200953 (Accession XM_117302) is another VGAM297 host target gene. LOC200953 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200953, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC200953 BINDING SITE, designated SEQ ID:3482, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8844] Another function of VGAM297 is therefore inhibition of LOC200953 (Accession XM_117302). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200953. LOC257541 (Accession XM_175175) is another VGAM297 host target gene. LOC257541 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257541, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257541 BINDING SITE, designated SEQ ID:3746, to the nucleotide sequence of VGAM297 RNA, herein designated VGAM RNA, also designated SEQ ID:632.

[8845] Another function of VGAM297 is therefore inhibition of LOC257541 (Accession XM_175175). Accordingly, utilities of VGAM297 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257541. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 298 (VGAM298) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8846] VGAM298 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM298 was detected is described hereinabove with reference to Figs. 1–8.

[8847] VGAM298 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8848] VGAM298 gene encodes a VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM298 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM298 precursor RNA is designated SEQ ID:284, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:284 is located at position 173577 relative to the genome of Vac–

cinia Virus.

[8849] VGAM298 precursor RNA folds onto itself, forming VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8850] An enzyme complex designated DICER COMPLEX, `dices` the VGAM298 folded precursor RNA into VGAM298 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 79%) nucleotide sequence of VGAM298 RNA is designated SEQ ID:633, and is provided hereinbelow with reference to the sequence listing part.

[8851] VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM298 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8852] VGAM298 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM298 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM298 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8853] The complementary binding of VGAM298 RNA, herein designated VGAM RNA, to host target binding sites on VGAM298 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM298 host target RNA into VGAM298 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8854] It is appreciated that VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM298 host target genes. The mRNA of each one of this plurality of VGAM298 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM298 RNA, herein designated VGAM RNA, and which when bound by VGAM298 RNA causes inhibition of translation of respective one or more VGAM298 host target proteins.

[8855] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM298 gene, herein designated VGAM GENE, on one or more VGAM298 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8856] It is yet further appreciated that a function of VGAM298 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM298 correlate

with, and may be deduced from, the identity of the host target genes which VGAM298 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8857] Nucleotide sequences of the VGAM298 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM298 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM298 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM298 are further described hereinbelow with reference to Table 1.

[8858] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM298 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM298 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8859] As mentioned hereinabove with reference to Fig. 1, a function of VGAM298 gene, herein designated VGAM is inhibition of expression of VGAM298 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM298 correlate with, and may be deduced

from, the identity of the target genes which VGAM298 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8860] G2 (Accession XM_039515) is a VGAM298 host target gene. G2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by G2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of G2 BINDING SITE, designated SEQ ID:2756, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:633.

[8861] A function of VGAM298 is therefore inhibition of G2 (Accession XM_039515). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with G2. RAS (RAD and GEM)-like GTP-binding (REM, Accession NM_014012) is another VGAM298 host target gene. REM BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by REM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

REM BINDING SITE, designated SEQ ID:1462, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:633.

[8862] Another function of VGAM298 is therefore inhibition of RAS (RAD and GEM)–like GTP–binding (REM, Accession NM_014012). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with REM. LOC90321 (Accession XM_030896) is another VGAM298 host target gene. LOC90321 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC90321, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90321 BINDING SITE, designated SEQ ID:2631, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:633.

[8863] Another function of VGAM298 is therefore inhibition of LOC90321 (Accession XM_030896). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90321. LOC91650 (Accession XM_039853) is another

VGAM298 host target gene. LOC91650 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91650 BINDING SITE, designated SEQ ID:2766, to the nucleotide sequence of VGAM298 RNA, herein designated VGAM RNA, also designated SEQ ID:633.

[8864] Another function of VGAM298 is therefore inhibition of LOC91650 (Accession XM_039853). Accordingly, utilities of VGAM298 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91650. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 299 (VGAM299) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8865] VGAM299 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM299 was detected is described

hereinabove with reference to Figs. 1–8.

[8866] VGAM299 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8867] VGAM299 gene encodes a VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM299 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM299 precursor RNA is designated SEQ ID:285, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:285 is located at position 168765 relative to the genome of Vaccinia Virus.

[8868] VGAM299 precursor RNA folds onto itself, forming VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8869] An enzyme complex designated DICER COMPLEX, `dices` the VGAM299 folded precursor RNA into VGAM299 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 25%) nucleotide sequence of VGAM299 RNA is designated SEQ ID:634, and is provided hereinbelow with reference to the sequence listing part.

[8870] VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM299 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8871] VGAM299 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM299 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM299 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM299 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8872] The complementary binding of VGAM299 RNA, herein designated VGAM RNA, to host target binding sites on VGAM299 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM299 host target RNA into VGAM299 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8873] It is appreciated that VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM299 host target genes. The mRNA of each one of this plurality of VGAM299 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM299 RNA, herein designated VGAM RNA, and which when bound by VGAM299 RNA causes inhibition of translation of respective one or more VGAM299 host target proteins.

[8874] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM299 gene, herein designated VGAM GENE, on one or more VGAM299 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8875] It is yet further appreciated that a function of VGAM299 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM299 correlate with, and may be deduced from, the identity of the host target genes which VGAM299 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8876] Nucleotide sequences of the VGAM299 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM299 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM299 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM299 are further described hereinbelow with reference to Table 1.

[8877] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM299 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM299 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8878] As mentioned hereinabove with reference to Fig. 1, a function of VGAM299 gene, herein designated VGAM is inhibition of expression of VGAM299 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM299 correlate with, and may be deduced from, the identity of the target genes which VGAM299 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8879] CD28 Antigen (Tp44) (CD28, Accession NM_006139) is a VGAM299 host target gene. CD28 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD28 BINDING SITE, designated SEQ ID:1274, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:634.

[8880] A function of VGAM299 is therefore inhibition of CD28 Antigen (Tp44) (CD28, Accession NM_006139), a gene which possibly involved in t-cell activation. Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD28. The function of CD28 has been established by previous studies. Monoclonal antibodies recognize 3 antigens, CD3 (OMIM Ref. No. 186790), CD2 (OMIM Ref. No. 186990), and CD28 (Tp44), that cause human T cells to proliferate in the presence of phorbol esters. Whereas CD3 appeared to be involved in transduction of the signal generated by antigen binding to the T-cell receptor, the role of the CD2 and CD28 antigens in physiologic proliferation was not understood. Aruffo and Seed (1987) isolated a cDNA clone encoding CD28 by a simple and highly efficient cloning strategy based on transient expression. In COS cells the CD28 encodes a highly glycosylated membrane protein with homology to the immunoglobulin

superfamily. Animal model experiments lend further support to the function of CD28. CD28 undergoes tyrosine phosphorylation after interacting with its ligand, B7 (CD80; 112203). Phosphorylation of tyr173 (tyr170 in mouse) in the cytoplasmic domain of CD28 allows the recruitment of signaling proteins such as phosphatidylinositol 3-kinase (see OMIM Ref. No. PIK3R1; 171833), GRB2 (OMIM Ref. No. 108355), and GADS (GRAP2; 604518) via their SH2 domains. Okkenhaug et al. (2001) reconstituted CD28 knockout mice with transgenes encoding wildtype Cd28 or Cd28 carrying a tyr170-to-phe mutation. Mutant Cd28 did not bind to the SH2 domain of PIK3R1, resulting in diminished protein kinase B (OMIM Ref. No. 164730) activation. Mutant Cd28 was able to prevent the induction of anergy, to promote T-cell proliferation and interleukin-2 (IL2; 147680) secretion, and to provide B-cell help, but was unable to upregulate expression of the prosurvival protein BCLXL (OMIM Ref. No. 600039). The defect in BCLXL upregulation was correlated with increased susceptibility of the T cells to gamma radiation. Okkenhaug et al. (2001) suggested that other tyrosine residues or asn172 may be critical to functions not affected by the tyr170-to-phe mutation.

- [8881] It is appreciated that the abovementioned animal model for CD28 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.
- [8882] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8883] Aruffo, A.; Seed, B. : Molecular cloning of a CD28 cDNA by a high-efficiency COS cell expression system. Proc. Nat. Acad. Sci. 84: 8573–8577, 1987. ; and
- [8884] Okkenhaug, K.; Wu, L.; Garza, K. M.; La Rose, J.; Khoo, W.; Odermatt, B.; Mak, T. W.; Ohashi, P. S.; Rottapel, R. : A point mutation in CD28 distinguishes proliferative signals from sur.
- [8885] Further studies establishing the function and utilities of CD28 are found in John Hopkins OMIM database record ID 186760, and in sited publications numbered 1323–95 and 1324–1327 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATP-binding Cassette, Sub-family A (ABC1), Member 6 (ABCA6, Accession NM_080284) is another VGAM299 host target gene. ABCA6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by ABCA6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABCA6 BINDING SITE, designated SEQ ID:2374, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:634.

[8886] Another function of VGAM299 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 6 (ABCA6, Accession NM_080284). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA6. FLJ21302 (Accession NM_022901) is another VGAM299 host target gene. FLJ21302 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21302 BINDING SITE, designated SEQ ID:2021, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:634.

[8887] Another function of VGAM299 is therefore inhibition of

FLJ21302 (Accession NM_022901). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21302. Solute Carrier Family 7, (cationic amino acid transporter, γ^+ system) Member 11 (SLC7A11, Accession NM_014331) is another VGAM299 host target gene. SLC7A11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC7A11 BINDING SITE, designated SEQ ID:1492, to the nucleotide sequence of VGAM299 RNA, herein designated VGAM RNA, also designated SEQ ID:634.

[8888] Another function of VGAM299 is therefore inhibition of Solute Carrier Family 7, (cationic amino acid transporter, γ^+ system) Member 11 (SLC7A11, Accession NM_014331). Accordingly, utilities of VGAM299 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A11. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 300 (VGAM300) viral

gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8889] VGAM300 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM300 was detected is described hereinabove with reference to Figs. 1–8.

[8890] VGAM300 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8891] VGAM300 gene encodes a VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM300 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM300 precursor RNA is designated SEQ ID:286, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:286 is located at position 172477 relative to the genome of Vaccinia Virus.

[8892] VGAM300 precursor RNA folds onto itself, forming

VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8893] An enzyme complex designated DICER COMPLEX, `dices` the VGAM300 folded precursor RNA into VGAM300 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM300 RNA is designated SEQ ID:635, and is provided hereinbelow with reference to the sequence listing part.

[8894] VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM300 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8895] VGAM300 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM300 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM300 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8896] The complementary binding of VGAM300 RNA, herein designated VGAM RNA, to host target binding sites on VGAM300 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM300 host target RNA into VGAM300 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8897] It is appreciated that VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM300 host target genes. The mRNA of each one of this plurality of VGAM300 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM300 RNA, herein designated VGAM RNA, and which when bound by VGAM300 RNA causes inhibition of translation of respective one or more VGAM300 host target proteins.

[8898] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM300 gene, herein designated VGAM GENE, on one or more VGAM300 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8899] It is yet further appreciated that a function of VGAM300 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM300 correlate with, and may be deduced from, the identity of the host target genes which VGAM300 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[8900] Nucleotide sequences of the VGAM300 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM300 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM300 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM300 are further described hereinbelow with reference to Table 1.

[8901] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM300 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM300 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8902] As mentioned hereinabove with reference to Fig. 1, a function of VGAM300 gene, herein designated VGAM is inhibition of expression of VGAM300 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM300 correlate with, and may be deduced from, the identity of the target genes which VGAM300 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[8903] Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282) is a VGAM300 host target gene. AP2B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP2B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP2B1 BINDING SITE, designated SEQ ID:814, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8904] A function of VGAM300 is therefore inhibition of Adaptor-related Protein Complex 2, Beta 1 Subunit (AP2B1, Accession NM_001282), a gene which links clathrin to receptors in coated vesicles. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP2B1. The function of AP2B1 has been established by previous studies. The beta adaptin subunit of the clathrin coat assembly complex, also referred to as AP2-beta, was cloned from human, rat and bovine cDNA libraries by Ponnambalam et al. (1990) who found that the predicted 937-amino acid proteins are totally conserved between species. The protein is part of

the AP2 coat assembly protein complex (see OMIM Ref. No. 601024) and links clathrin (OMIM Ref. No. 118960) to receptors in the coated vesicles. Druck et al. (1995) used a probe from the 3-prime UTR of the human cDNA to map the gene to chromosome 17. Hybrids with portions of chromosome 17 were then used to localize CLAPB1 to 17q11.2-q12.

[8905] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8906] Druck, T.; Gu, Y.; Prabhala. G.; Cannizzaro, L. A.; Park, S.-H.; Huebner, K.; Keen, J. H. : Chromosome localization of human genes for clathrin adaptor polypeptides AP2-beta and AP50 and the clathrin-binding protein, VCP. Genomics 30: 94-97, 1995. ; and

[8907] Ponnambalam, S.; Robinson, M. S.; Jackson, A. P.; Peiperl, L.; Parham, P. : Conservation and diversity in families of coated vesicle adaptins. J. Biol. Chem. 265: 4814-4820, 1990.

[8908] Further studies establishing the function and utilities of AP2B1 are found in John Hopkins OMIM database record ID 601025, and in cited publications numbered 2239-2240 listed in the bibliography section hereinbelow,

which are also hereby incorporated by reference. Glutamic-oxaloacetic Transaminase 1, Soluble (aspartate aminotransferase 1) (GOT1, Accession NM_002079) is another VGAM300 host target gene. GOT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOT1 BINDING SITE, designated SEQ ID:897, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8909] Another function of VGAM300 is therefore inhibition of Glutamic-oxaloacetic Transaminase 1, Soluble (aspartate aminotransferase 1) (GOT1, Accession NM_002079), a gene which reversibly transfers amino group from aspartate to 2-oxoglutarate to form oxaloacetate and glutamate. Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOT1. The function of GOT1 has been established by previous studies. Glutamate oxaloacetate transaminase (EC 2.6.1.1) is a ubiquitous pyridoxal phosphate-dependent enzyme which exists in both mito-

chondrial (OMIM Ref. No. 138150) and cytosolic forms. The enzyme plays an important role in amino acid metabolism and in the urea and tricarboxylic acid cycles. The 2 isoenzymes are homodimeric. In liver about 80% of the enzyme activity is mitochondrial in origin, whereas in serum the enzyme activity is largely cytosolic. Although the mitochondrial and soluble forms of GOT are coded by different chromosomes (according to a rule that has few exceptions; McKusick, 1986), the 2 show close homology in amino acid sequence and were presumably derived from a common ancestral gene (Ford et al., 1980; Doonan et al., 1984). Panteghini (1990) reviewed the clinical usefulness of assays for aspartate aminotransferase (AST) isoenzymes in serum. By analysis of mouse-human somatic cell hybrids, Creagan et al. (1973) concluded that the structural locus for cytoplasmic glutamate oxaloacetate transaminase is on chromosome 10. Spritz et al. (1979) studied soluble GOT activity in fibroblasts of 2 persons with duplications of the long arm of chromosome 10. Since the 2 differed by only half a band, the authors concluded that the structural locus is on band 10q24. Koch et al. (1981) pointed out that GOT1 and LIPA (OMIM Ref. No. 278000) are also syntenic on chromosome 19 of

the mouse. Junien et al. (1982) assigned GOT1 and PGAMA (OMIM Ref. No. 172250) to 10q26.1 (or 10q25.3) by dosage studies. Pol et al. (1988) cloned cDNAs corresponding to human liver cytosolic and mitochondrial aspartate aminotransferase mRNAs. Pol et al. (1989) used these cDNA probes to locate the GOT1 gene in the region 10q24.1–q25.1 by in situ hybridization. Wang et al. (1999) located the GOT1 gene within the critical region for the urofacial syndrome (OMIM Ref. No. 236730), between markers D10S198 and D10S2494, but excluded it as a candidate for that disorder by mutation analysis.

[8910] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8911] McKusick, V. A. : The morbid anatomy of the human genome: a review of gene mapping in clinical medicine (part 1). Medicine 65: 1–33, 1986. ; and

[8912] Wang, C.–Y.; Huang, Y.–Q.; Shi, J.–O.; Marron, M. P.; Ruan, Q.–G.; Hawkins–Lee, B.; Ochoa, B.; She, J.–X. : Genetic homogeneity, high–resolution mapping, and mutation analysis of the u.

[8913] Further studies establishing the function and utilities of GOT1 are found in John Hopkins OMIM database record ID

138180, and in cited publications numbered 2757–2758, 690, 2759–2761, 2763, 2767–2769, 402, 88 and 2770–2774 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 14 (KOX 6) (ZNF14, Accession NM_021030) is another VGAM300 host target gene. ZNF14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF14 BINDING SITE, designated SEQ ID:1934, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8914] Another function of VGAM300 is therefore inhibition of Zinc Finger Protein 14 (KOX 6) (ZNF14, Accession NM_021030). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF14. FLJ11827 (Accession NM_025093) is another VGAM300 host target gene. FLJ11827 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11827, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11827 BINDING SITE, designated SEQ ID:2136, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8915] Another function of VGAM300 is therefore inhibition of FLJ11827 (Accession NM_025093). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11827. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM300 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:1507, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8916] Another function of VGAM300 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of

VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL.

LOC158722 (Accession XM_088653) is another VGAM300 host target gene. LOC158722 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158722, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158722 BINDING SITE, designated SEQ ID:3226, to the nucleotide sequence of VGAM300 RNA, herein designated VGAM RNA, also designated SEQ ID:635.

[8917] Another function of VGAM300 is therefore inhibition of LOC158722 (Accession XM_088653). Accordingly, utilities of VGAM300 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158722. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 301 (VGAM301) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8918] VGAM301 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM301 was detected is described hereinabove with reference to Figs. 1–8.

[8919] VGAM301 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8920] VGAM301 gene encodes a VGAM301 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM301 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM301 precursor RNA is designated SEQ ID:287, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:287 is located at position 174245 relative to the genome of Vaccinia Virus.

[8921] VGAM301 precursor RNA folds onto itself, forming VGAM301 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8922] An enzyme complex designated DICER COMPLEX, `dices` the VGAM301 folded precursor RNA into VGAM301 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM301 RNA is designated SEQ ID:636, and is provided hereinbelow with reference to the sequence listing part.

[8923] VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM301 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[8924] VGAM301 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM301 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM301 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8925] The complementary binding of VGAM301 RNA, herein designated VGAM RNA, to host target binding sites on VGAM301 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM301 host target RNA into VGAM301 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8926] It is appreciated that VGAM301 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM301 host target genes. The mRNA of each one of this plurality of VGAM301 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM301 RNA, herein designated VGAM RNA, and which when bound by VGAM301 RNA causes inhibition of translation of respective one or more VGAM301 host target proteins.

[8927] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM301 gene, herein designated VGAM GENE, on one or more VGAM301 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8928] It is yet further appreciated that a function of VGAM301 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM301 correlate with, and may be deduced from, the identity of the host target genes which VGAM301 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8929] Nucleotide sequences of the VGAM301 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM301 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM301 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM301 are further
described hereinbelow with reference to Table 1.

[8930] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM301 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM301 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8931] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM301 gene, herein designated VGAM is
inhibition of expression of VGAM301 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM301 correlate with, and may be deduced
from, the identity of the target genes which VGAM301
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[8932] A Disintegrin-like and Metalloprotease (reprolysin type)
with Thrombospondin Type 1 Motif, 5 (aggrecanase-2)

(ADAMTS5, Accession NM_007038) is a VGAM301 host target gene. ADAMTS5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADAMTS5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAMTS5 BINDING SITE, designated SEQ ID:1350, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:636.

[8933] A function of VGAM301 is therefore inhibition of A Disintegrin-like and Metalloprotease (reprolysin type) with Thrombospondin Type 1 Motif, 5 (aggrecanase-2) (ADAMTS5, Accession NM_007038), a gene which cleaves aggrecan, a cartilage proteoglycan, and may be involved in its turnover. Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAMTS5. The function of ADAMTS5 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM49.Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018) is another VGAM301 host target

gene. SLC38A4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC38A4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A4 BINDING SITE, designated SEQ ID:1774, to the nucleotide sequence of VGAM301 RNA, herein designated VGAM RNA, also designated SEQ ID:636.

[8934] Another function of VGAM301 is therefore inhibition of Solute Carrier Family 38, Member 4 (SLC38A4, Accession NM_018018). Accordingly, utilities of VGAM301 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 302 (VGAM302) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8935] VGAM302 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM302 was detected is described

hereinabove with reference to Figs. 1–8.

[8936] VGAM302 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8937] VGAM302 gene encodes a VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM302 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM302 precursor RNA is designated SEQ ID:288, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:288 is located at position 175500 relative to the genome of Vaccinia Virus.

[8938] VGAM302 precursor RNA folds onto itself, forming VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an

accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8939] An enzyme complex designated DICER COMPLEX, `dices` the VGAM302 folded precursor RNA into VGAM302 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM302 RNA is designated SEQ ID:637, and is provided hereinbelow with reference to the sequence listing part.

[8940] VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM302 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8941] VGAM302 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites lo-

cated in untranslated regions of VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM302 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM302 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM302 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8942] The complementary binding of VGAM302 RNA, herein designated VGAM RNA, to host target binding sites on VGAM302 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM302 host target RNA into VGAM302 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8943] It is appreciated that VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM302 host target genes. The mRNA of each one of this plurality of VGAM302 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM302 RNA, herein designated VGAM RNA, and which when bound by VGAM302 RNA causes inhibition of translation of respective one or more VGAM302 host target proteins.

[8944] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM302 gene, herein designated VGAM GENE, on one or more VGAM302 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a spe-

cific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8945] It is yet further appreciated that a function of VGAM302 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM302 correlate with, and may be deduced from, the identity of the host target genes which VGAM302 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8946] Nucleotide sequences of the VGAM302 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM302 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding

of VGAM302 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM302 are further described hereinbelow with reference to Table 1.

[8947] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM302 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM302 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8948] As mentioned hereinabove with reference to Fig. 1, a function of VGAM302 gene, herein designated VGAM is inhibition of expression of VGAM302 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM302 correlate with, and may be deduced from, the identity of the target genes which VGAM302 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8949] Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421) is a VGAM302 host target gene. SLC19A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC19A2, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A2 BINDING SITE, designated SEQ ID:2835, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:637.

[8950] A function of VGAM302 is therefore inhibition of Solute Carrier Family 19 (thiamine transporter), Member 2 (SLC19A2, Accession XM_044421). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A2. Collectin Sub-family Member 12 (COLEC12, Accession NM_030781) is another VGAM302 host target gene. COLEC12 BINDING SITE1 and COLEC12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by COLEC12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COLEC12 BINDING SITE1 and COLEC12 BINDING SITE2, designated SEQ ID:2165 and SEQ ID:2395 respectively, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:637.

[8951] Another function of VGAM302 is therefore inhibition of Collectin Sub-family Member 12 (COLEC12, Accession NM_030781). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COLEC12. LOC150848 (Accession XM_097959) is another VGAM302 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:3334, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:637.

[8952] Another function of VGAM302 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. LOC219846 (Accession XM_165591) is another VGAM302 host target gene. LOC219846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219846, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219846 BINDING SITE, designated SEQ ID:3504, to the nucleotide sequence of VGAM302 RNA, herein designated VGAM RNA, also designated SEQ ID:637.

[8953] Another function of VGAM302 is therefore inhibition of LOC219846 (Accession XM_165591). Accordingly, utilities of VGAM302 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219846. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 303 (VGAM303) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8954] VGAM303 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM303 was detected is described hereinabove with reference to Figs. 1–8.

[8955] VGAM303 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8956] VGAM303 gene encodes a VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM303 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM303 precursor RNA is designated SEQ ID:289, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:289 is located at position 9636 relative to the genome of Vaccinia Virus.

[8957] VGAM303 precursor RNA folds onto itself, forming VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8958] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM303 folded precursor RNA into VGAM303 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM303 RNA is designated SEQ ID:638, and is provided hereinbelow with reference to the sequence listing part.

[8959] VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM303 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8960] VGAM303 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM303 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM303 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8961] The complementary binding of VGAM303 RNA, herein designated VGAM RNA, to host target binding sites on VGAM303 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM303 host target RNA into VGAM303 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8962] It is appreciated that VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM303 host target genes. The mRNA of each one of this plurality of VGAM303 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM303 RNA, herein designated VGAM RNA, and which when bound by VGAM303 RNA causes inhibition of translation of respective one or more VGAM303 host target proteins.

[8963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM303 gene, herein designated VGAM GENE, on one or more VGAM303 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8964] It is yet further appreciated that a function of VGAM303 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM303 correlate with, and may be deduced from, the identity of the host target genes which VGAM303 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8965] Nucleotide sequences of the VGAM303 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM303 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM303 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM303 are further described hereinbelow with reference to Table 1.

[8966] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM303 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM303 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8967] As mentioned hereinabove with reference to Fig. 1, a function of VGAM303 gene, herein designated VGAM is inhibition of expression of VGAM303 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM303 correlate with, and may be deduced from, the identity of the target genes which VGAM303 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8968] Dopamine Receptor D1 (DRD1, Accession NM_000794) is a VGAM303 host target gene. DRD1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DRD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DRD1 BINDING SITE, designated SEQ ID:774, to the nucleotide sequence of

VGAM303 RNA, herein designated VGAM RNA, also designated SEQ ID:638.

[8969] A function of VGAM303 is therefore inhibition of Dopamine Receptor D1 (DRD1, Accession NM_000794), a gene which is mediated by g proteins which activate adenylyl cyclase. Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DRD1. The function of DRD1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM58.KIAA0182 (Accession XM_050495) is another VGAM303 host target gene. KIAA0182 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0182, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0182 BINDING SITE, designated SEQ ID:2931, to the nucleotide sequence of VGAM303 RNA, herein designated VGAM RNA, also designated SEQ ID:638.

[8970] Another function of VGAM303 is therefore inhibition of KIAA0182 (Accession XM_050495). Accordingly, utilities

of VGAM303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0182. SSH2 (Accession XM_030846) is another VGAM303 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:2626, to the nucleotide sequence of VGAM303 RNA, herein designated VGAM RNA, also designated SEQ ID:638.

[8971] Another function of VGAM303 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC90918 (Accession XM_034863) is another VGAM303 host target gene. LOC90918 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90918, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90918 BINDING

SITE, designated SEQ ID:2687, to the nucleotide sequence of VGAM303 RNA, herein designated VGAM RNA, also designated SEQ ID:638.

[8972] Another function of VGAM303 is therefore inhibition of LOC90918 (Accession XM_034863). Accordingly, utilities of VGAM303 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90918. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 304 (VGAM304) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8973] VGAM304 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM304 was detected is described hereinabove with reference to Figs. 1–8.

[8974] VGAM304 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8975] VGAM304 gene encodes a VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM304 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM304 precursor RNA is designated SEQ ID:290, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:290 is located at position 179183 relative to the genome of Vaccinia Virus.

[8976] VGAM304 precursor RNA folds onto itself, forming VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8977] An enzyme complex designated DICER COMPLEX, `dices` the VGAM304 folded precursor RNA into VGAM304 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM304 RNA is designated SEQ ID:639, and is provided hereinbelow with reference to the sequence listing part.

[8978] VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM304 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8979] VGAM304 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM304 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM304 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[8980] The complementary binding of VGAM304 RNA, herein designated VGAM RNA, to host target binding sites on VGAM304 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM304 host target RNA into VGAM304 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8981] It is appreciated that VGAM304 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM304 host target genes. The mRNA of each one of this plurality of VGAM304 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM304 RNA, herein designated VGAM RNA, and which when bound by VGAM304 RNA causes inhibition of translation of respective one or more VGAM304 host target proteins.

[8982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM304 gene, herein designated VGAM GENE, on one or more VGAM304 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[8983] It is yet further appreciated that a function of VGAM304 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM304 correlate with, and may be deduced from, the identity of the host target genes which VGAM304 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8984] Nucleotide sequences of the VGAM304 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM304 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM304 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM304 are further described hereinbelow with reference to Table 1.

[8985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM304 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM304 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8986] As mentioned hereinabove with reference to Fig. 1, a function of VGAM304 gene, herein designated VGAM is inhibition of expression of VGAM304 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM304 correlate with, and may be deduced from, the identity of the target genes which VGAM304 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8987] Platelet-activating Factor Acetylhydrolase, Isoform Ib, Beta Subunit 30kDa (PAFAH1B2, Accession NM_002572) is a VGAM304 host target gene. PAFAH1B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH1B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B2 BINDING SITE, designated SEQ ID:937, to the nucleotide sequence of VGAM304 RNA, herein designated VGAM RNA, also designated SEQ ID:639.

[8988] A function of VGAM304 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Beta Subunit 30kDa (PAFAH1B2, Accession NM_002572), a gene which inactivates paf by removing the acetyl group at the sn-2 position. Accordingly, utilities of VGAM304 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B2. The function of PAFAH1B2 has been established by previous studies. Platelet-activating factor (PAF) is a biologically active phospholipid with diverse biologic effects. PAF is degraded to inactive products by hydrolysis of the acetyl group at the sn-2 position to produce the biologically inactive products LYSO-PAF and acetate. This reaction is catalyzed by PAF acetylhydrolase (PAFAH). The various monomeric and multimeric forms of the enzyme are composed of alpha (OMIM Ref. No. 601545), beta, and gamma (OMIM Ref. No. 603074) PAFAH subunits. By screening a human fetal liver library with 2 oligodeoxyribonucleotides derived from the cDNA sequence of the bovine PAFAH beta subunit, Adachi et al. (1997) cloned the cDNA encoding the human PAFAH beta subunit. The PAFAH1B2 gene encodes a 229-amino acid polypeptide with a molecular mass of 30 kD. The human PAFAH1B2 amino acid se-

quence is 62.4% identical to that of the human gamma subunit. Northern blot analysis revealed that the gene was expressed as a 4.0-kb mRNA in all human adult and fetal tissues tested. By radiation hybrid mapping, screening of a YAC library, and fluorescence in situ hybridization, Moro et al. (1998) localized the PAFAH1B2 gene to 11q23.

[8989] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8990] Adachi, H.; Tsujimoto, M.; Hattori, M.; Arai, H.; Inoue, K. : Differential tissue distribution of the beta- and gamma-subunits of human cytosolic platelet-activating factor acetylhydrolase (isoform 1). *Biochem. Biophys. Res. Commun.* 233: 10-13, 1997. ; and

[8991] Moro, F.; Arrigo, G.; Fogli, A.; Bernard, L.; Carrozzo, R. : The beta and gamma subunits of the human platelet-activating factor acetyl hydrolase isoform Ib (PAFAH1B2 and PAFAH1B3) map t.

[8992] Further studies establishing the function and utilities of PAFAH1B2 are found in John Hopkins OMIM database record ID 602508, and in cited publications numbered 2025-2026 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fig. 1

further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 305 (VGAM305) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8993] VGAM305 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM305 was detected is described hereinabove with reference to Figs. 1–8.

[8994] VGAM305 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8995] VGAM305 gene encodes a VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM305 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM305 precursor RNA is designated SEQ ID:291, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:291 is

located at position 179295 relative to the genome of Vac-
cinia Virus.

[8996] VGAM305 precursor RNA folds onto itself, forming VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8997] An enzyme complex designated DICER COMPLEX, `dices` the VGAM305 folded precursor RNA into VGAM305 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM305 RNA is designated SEQ ID:640, and is provided hereinbelow with reference to the sequence listing part.

[8998] VGAM305 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM305 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8999] VGAM305 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM305 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM305 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM305 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9000] The complementary binding of VGAM305 RNA, herein designated VGAM RNA, to host target binding sites on VGAM305 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM305 host target RNA into VGAM305 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9001] It is appreciated that VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM305 host target genes. The mRNA of each one of this plurality of VGAM305 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM305 RNA, herein designated VGAM RNA, and which when bound by VGAM305 RNA causes inhibition of translation of respective one or more VGAM305

host target proteins.

[9002] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM305 gene, herein designated VGAM GENE, on one or more VGAM305 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9003] It is yet further appreciated that a function of VGAM305 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM305 correlate with, and may be deduced from, the identity of the host target genes which VGAM305 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9004] Nucleotide sequences of the VGAM305 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM305 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM305 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM305 are further described hereinbelow with reference to Table 1.

[9005] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM305 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM305 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9006] As mentioned hereinabove with reference to Fig. 1, a function of VGAM305 gene, herein designated VGAM is inhibition of expression of VGAM305 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM305 correlate with, and may be deduced from, the identity of the target genes which VGAM305 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9007] GL004 (Accession XM_038373) is a VGAM305 host target gene. GL004 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GL004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GL004 BINDING SITE, designated SEQ ID:2736, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:640.

[9008] A function of VGAM305 is therefore inhibition of GL004 (Accession XM_038373). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GL004. KIAA1336 (Accession XM_051306) is another VGAM305 host target gene. KIAA1336 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1336, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1336 BINDING SITE, designated SEQ ID:2942, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:640.

[9009] Another function of VGAM305 is therefore inhibition of KIAA1336 (Accession XM_051306). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1336. LOC147711 (Accession XM_085851) is another VGAM305 host target gene. LOC147711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147711 BINDING SITE, designated SEQ ID:3112, to the nucleotide sequence of VGAM305 RNA, herein designated VGAM RNA, also designated SEQ ID:640.

[9010] Another function of VGAM305 is therefore inhibition of LOC147711 (Accession XM_085851). Accordingly, utilities of VGAM305 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC147711. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 306 (VGAM306) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9011] VGAM306 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM306 was detected is described hereinabove with reference to Figs. 1–8.

[9012] VGAM306 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9013] VGAM306 gene encodes a VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM306 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM306 precursor RNA is designated SEQ ID:292, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:292 is located at position 176521 relative to the genome of Vaccinia Virus.

[9014] VGAM306 precursor RNA folds onto itself, forming VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9015] An enzyme complex designated DICER COMPLEX, `dices` the VGAM306 folded precursor RNA into VGAM306 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM306 RNA is designated SEQ ID:641, and is provided hereinbelow with reference to the sequence listing part.

[9016] VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM306 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9017] VGAM306 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM306 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM306 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9018] The complementary binding of VGAM306 RNA, herein designated VGAM RNA, to host target binding sites on VGAM306 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM306 host target RNA into VGAM306 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9019] It is appreciated that VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM306 host target genes. The mRNA of each one of this plurality of VGAM306 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM306 RNA, herein designated VGAM RNA, and which when bound by VGAM306 RNA causes in-

hibition of translation of respective one or more VGAM306 host target proteins.

[9020] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM306 gene, herein designated VGAM GENE, on one or more VGAM306 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9021] It is yet further appreciated that a function of VGAM306 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM306 include diagnosis, prevention and

treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM306 correlate with, and may be deduced from, the identity of the host target genes which VGAM306 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9022] Nucleotide sequences of the VGAM306 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM306 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM306 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM306 are further described hereinbelow with reference to Table 1.

[9023] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM306 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM306 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9024] As mentioned hereinabove with reference to Fig. 1, a function of VGAM306 gene, herein designated VGAM is inhibition of expression of VGAM306 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM306 correlate with, and may be deduced from, the identity of the target genes which VGAM306 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9025] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781) is a VGAM306 host target gene. B3GALT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GALT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT3 BINDING SITE, designated SEQ ID:1058, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9026] A function of VGAM306 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 3 (B3GALT3, Accession NM_003781). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT3. Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384) is another VGAM306 host target

gene. CSNK1G3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSNK1G3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSNK1G3 BINDING SITE, designated SEQ ID:1106, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9027] Another function of VGAM306 is therefore inhibition of Casein Kinase 1, Gamma 3 (CSNK1G3, Accession NM_004384). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSNK1G3. Desmocollin 3 (DSC3, Accession NM_024423) is another VGAM306 host target gene. DSC3 BINDING SITE1 and DSC3 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DSC3, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSC3 BINDING SITE1 and DSC3 BINDING SITE2, designated SEQ ID:2061 and SEQ ID:872 respectively, to the nucleotide

sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9028] Another function of VGAM306 is therefore inhibition of Desmocollin 3 (DSC3, Accession NM_024423), a gene which is a component of intercellular desmosome junctions. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSC3. The function of DSC3 has been established by previous studies. From a bladder carcinoma cell line cDNA library, Kawamura et al. (1994) cloned a human cDNA encoding for a novel transmembrane protein. Sequence analysis revealed an open reading frame of 2,691 bp encoding a protein of 896 amino acids. Sequence comparisons showed significant homology to desmocollins, intercellular adhesion molecules belonging to the cadherin superfamily. The protein consisted of a signal peptide of 30 amino acids, a precursor segment of 105 amino acids, and a mature protein of 761 amino acids. Antibodies recognizing the predicted mature adhesion molecule of the protein stained antigens along the cell boundaries of normal human keratinocytes resembling the pattern of desmosome localization. Kawamura et al. (1994) concluded that the clone represented a

new member of the desmocollin family and tentatively referred to it as desmocollin type 4. King et al. (1995) used the designation DSC3 for a gene encoding a desmocollin present in human foreskin epidermis and stated that the gene is identical to that encoding the desmocollin isolated from a bladder carcinoma cell line and called DSC4 by Kawamura et al. (1994). They likewise mapped the gene to chromosome 18 by PCR analysis of rodent/human somatic cell hybrids. They stated that the cDNA sequence showed 67% amino acid identity with the original human desmocollin, designated DSC2, and 52% amino acid identity with DSC1. By in situ hybridization studies, they showed that DSC1 was not present in any of the nonkeratinizing human epithelia, such as buccal mucosa, cervix, and esophagus, whereas all these internal epithelia expressed DSC2 and DSC3 and were present in most of the living layers of tissues, including the basal layers.

[9029] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9030] Kawamura, K.; Watanabe, K.; Suzuki, T.; Yamakawa, T.; Kamiyama, T.; Nakagawa, H.; Tsurufuji, S. : cDNA cloning and expression of a novel human desmocollin. J. Biol.

Chem. 269: 26295–26302, 1994. ; and

[9031] King, I. A.; Sullivan, K. H.; Bennett, R., Jr.; Buxton, R. S. :
The desmocollins of human foreskin epidermis: identification and chromosomal assignment of a third gene and expression p.

[9032] Further studies establishing the function and utilities of DSC3 are found in John Hopkins OMIM database record ID 600271, and in cited publications numbered 1659–1661 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SUV39H2 (Accession NM_024670) is another VGAM306 host target gene. SUV39H2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUV39H2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUV39H2 BINDING SITE, designated SEQ ID:2080, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9033] Another function of VGAM306 is therefore inhibition of SUV39H2 (Accession NM_024670), a gene which is involved in gene repression and the modification of posi-

tion-effect- variegation. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUV39H2. The function of SUV39H2 has been established by previous studies. O'Carroll et al. (2000) isolated and characterized a murine gene, Suv39h2, that encodes an H3 histone (see OMIM Ref. No. 601128) methyltransferase (OMIM Ref. No. HMTase) with 59% identity to Suv39h1 (OMIM Ref. No. 300254). Although both Suv39h loci displayed overlapping expression profiles during mouse embryogenesis, Suv39h2 transcripts remained specifically expressed in adult testes. Immunolocalization of the Suv39h2 protein during spermatogenesis indicated enriched distribution at the heterochromatin from the leptotene to the round spermatid stage. Moreover, Suv39h2 specifically accumulated with chromatin of the sex chromosomes (XY body), which undergo transcriptional silencing during the first meiotic prophase. These data were consistent with redundant enzymatic roles for Suv39h1 and Suv39h2 during mouse development and suggested an additional function of the Suv39h2 HMTase in organizing meiotic heterochromatin that may even impart an epigenetic imprint to the male germline. Animal model experiments lend further

support to the function of SUV39H2. Peters et al. (2001) generated mice deficient for either Suv39h1 or Suv39h2. These animals displayed normal viability and fertility and did not exhibit apparent phenotypes. The authors subsequently intercrossed Suv39h1 $-/-$ and Suv39h2 $-/-$ mice to generate compound Suv39h mutants that were then used to derive Suv39h double-null mice (Suv39h1 $-/-$ and Suv39h2 $-/-$). These mice displayed severely impaired viability and chromosomal instabilities that were associated with an increased tumor risk and perturbed chromosome interactions during male meiosis. These data suggested a crucial role for pericentric H3 histone-lys9 methylation in protecting genome stability and defined the Suv39h HMTases as important epigenetic regulators for mammalian development.

[9034] It is appreciated that the abovementioned animal model for SUV39H2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9036] O'Carroll, D.; Scherthan, H.; Peters, A. H. F. M.; Opravil, S.;

Haynes, A. R.; Laible, G.; Rea, S.; Schmid, M.; Lebersorger, A.; Jerratsch, M.; Sattler, L.; Mattei, M. G.; Denny, P.; Brown, S. D. M.; Schweizer, D.; Jenuwein, T. : Isolation and characterization of Suv39h2, a second histone H3 methyltransferase gene that displays testis-specific expression. Molec. Cell. Biol. 20: 9423–9433, 2000. ; and

[9037] Peters, A. H. F. M.; O'Carroll, D.; Scherthan, H.; Mechtler, K.; Sauer, S.; Schofer, C.; Weipoltshammer, K.; Pagani, M.; Lachner, M.; Kohlmaier, A.; Opravil, S.; Doyle, M.; Sibilia, M.

[9038] Further studies establishing the function and utilities of SUV39H2 are found in John Hopkins OMIM database record ID 606503, and in cited publications numbered 140 and 2031 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tachykinin, Precursor 1 (substance K, substance P, neurokinin 1, neurokinin 2, neuromedin L, neurokinin alpha, neuropeptide K, neuropeptide gamma) (TAC1, Accession NM_013996) is another VGAM306 host target gene. TAC1 BINDING SITE1 through TAC1 BINDING SITE4 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TAC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II

or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAC1 BINDING SITE1 through TAC1 BINDING SITE4, designated SEQ ID:1456, SEQ ID:1457, SEQ ID:1458 and SEQ ID:996 respectively, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9039] Another function of VGAM306 is therefore inhibition of Tachykinin, Precursor 1 (substance K, substance P, neurokinin 1, neurokinin 2, neuromedin L, neurokinin alpha, neuropeptide K, neuropeptide gamma) (TAC1, Accession NM_013996), a gene which is precursor of tachykinin-A (substance-K, neurokinin A) and substance-P, which modulate immune and nerve cells. Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAC1. The function of TAC1 has been established by previous studies. The tachykinins are a family of amidated neuropeptides that share a carboxy-terminal sequence Phe-X-Gly-Leu-Met-NH₂ and are found in both vertebrates and invertebrates. The 3 known tachykinins in man are encoded by 2 genes. One gene encodes a precursor containing both substance P and neurokinin A, while the other encodes a precursor containing only neurokinin B

(OMIM Ref. No. 162330). (Neurokinin A was formerly known as substance K.) Using probes derived from the cloned human genes and a panel of rodent–human somatic cell hybrids, Bonner et al. (1987) assigned the NKNA gene to 7q21–q22 and the NKNB gene to 12q13–q21. Molecular characterization of the tachykinins show that they arise from common precursor molecules known as preprotachykinins by proteolytic processing. Three forms of message (alpha, beta, and gamma) arise by alternative splicing events (Krause et al., 1987). The beta and gamma forms of preprotachykinins encode both substance P and neurokinin A, while the alpha form contains only the substance P sequence. Bahary et al. (1991) mapped the homologous gene to mouse chromosome 6. Cao et al. (1998) disrupted the mouse preprotachykinin A gene, which encodes both substance P and neurokinin A. The behavioral response to mildly painful stimuli was intact in mutant mice; however, the response to moderate to intense pain was significantly reduced. Neurogenic inflammation, which results from peripheral release of substance P and neurokinin A, is almost absent in the mutant mice. The contribution of substance P and neurokinin A is neither modality– nor tissue–specific; pain behaviors

evoked by thermal, mechanical, and chemical stimulation of somatic and visceral tissues were all reduced in the mutant mice. The authors concluded that the release of tachykinins from primary afferent pain-sensing receptors (nociceptors) is required to produce moderate to intense pain. Cao et al. (1998) proposed that glutamate is the neurotransmitter for basal pain response, that substance P and neurokinin A are released with higher stimuli, and that at the highest intensities, an undefined system comes into play.

[9040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9041] Bahary, N.; Zorich, G.; Pachter, J. E.; Leibel, R. L.; Friedman, J. M. : Molecular genetic linkage maps of mouse chromosomes 4 and 6. *Genomics* 11: 33–47, 1991. ; and

[9042] Cao, Y. Q.; Mantyh, P. W.; Carlson, E. J.; Gillespie, A.-M.; Epstein, C. J.; Basbaum, A. I. : Primary afferent tachykinins are required to experience moderate to intense pain. *Nature* 392.

[9043] Further studies establishing the function and utilities of TAC1 are found in John Hopkins OMIM database record ID 162320, and in cited publications numbered 111 and

2542–2547 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 207 (ZNF207, Accession NM_003457) is another VGAM306 host target gene. ZNF207 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF207, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF207 BINDING SITE, designated SEQ ID:1023, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9044] Another function of VGAM306 is therefore inhibition of Zinc Finger Protein 207 (ZNF207, Accession NM_003457). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF207. A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_005100) is another VGAM306 host target gene. AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AKAP12, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of AKAP12 BINDING SITE1 and AKAP12 BINDING SITE2, designated SEQ ID:1185 and SEQ ID:2481 respectively, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9045] Another function of VGAM306 is therefore inhibition of A Kinase (PRKA) Anchor Protein (gravin) 12 (AKAP12, Accession NM_005100). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP12. FLJ11222 (Accession NM_018365) is another VGAM306 host target gene. FLJ11222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11222, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11222 BINDING SITE, designated SEQ ID:1819, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9046] Another function of VGAM306 is therefore inhibition of FLJ11222 (Accession NM_018365). Accordingly, utilities of

VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11222. FLJ14641 (Accession NM_032817) is another VGAM306 host target gene. FLJ14641 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14641 BINDING SITE, designated SEQ ID:2284, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9047] Another function of VGAM306 is therefore inhibition of FLJ14641 (Accession NM_032817). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14641. FLJ23537 (Accession NM_024889) is another VGAM306 host target gene. FLJ23537 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23537, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23537 BINDING SITE,

designated SEQ ID:2105, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9048] Another function of VGAM306 is therefore inhibition of FLJ23537 (Accession NM_024889). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23537. KIAA1161 (Accession XM_088501) is another VGAM306 host target gene. KIAA1161 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1161 BINDING SITE, designated SEQ ID:3212, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9049] Another function of VGAM306 is therefore inhibition of KIAA1161 (Accession XM_088501). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1161. MGC10646 (Accession NM_032693) is another VGAM306 host target gene. MGC10646 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC10646, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10646 BINDING SITE, designated SEQ ID:2270, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9050] Another function of VGAM306 is therefore inhibition of MGC10646 (Accession NM_032693). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10646. Myeloid/lymphoid Or Mixed-lineage Leukemia 5 (trithorax homolog, Drosophila) (MLL5, Accession XM_168551) is another VGAM306 host target gene. MLL5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MLL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLL5 BINDING SITE, designated SEQ ID:3644, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9051] Another function of VGAM306 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia 5 (trithorax homolog, Drosophila) (MLL5, Accession XM_168551). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLL5. ZAK (Accession NM_133646) is another VGAM306 host target gene. ZAK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZAK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZAK BINDING SITE, designated SEQ ID:2426, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9052] Another function of VGAM306 is therefore inhibition of ZAK (Accession NM_133646). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZAK. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM306 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:1520, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9053] Another function of VGAM306 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC126661 (Accession XM_059061) is another VGAM306 host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:3000, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9054] Another function of VGAM306 is therefore inhibition of LOC126661 (Accession XM_059061). Accordingly, utilities

of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC139770 (Accession XM_060053) is another VGAM306 host target gene. LOC139770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139770 BINDING SITE, designated SEQ ID:3022, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9055] Another function of VGAM306 is therefore inhibition of LOC139770 (Accession XM_060053). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139770. LOC150577 (Accession XM_097918) is another VGAM306 host target gene. LOC150577 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150577 BINDING SITE, designated SEQ ID:3329, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9056] Another function of VGAM306 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC89919 (Accession XM_027244) is another VGAM306 host target gene. LOC89919 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC89919, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC89919 BINDING SITE, designated SEQ ID:2579, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9057] Another function of VGAM306 is therefore inhibition of LOC89919 (Accession XM_027244). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC89919. LOC92573 (Accession XM_045884) is another VGAM306 host target gene. LOC92573 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92573 BINDING SITE, designated SEQ ID:2869, to the nucleotide sequence of VGAM306 RNA, herein designated VGAM RNA, also designated SEQ ID:641.

[9058] Another function of VGAM306 is therefore inhibition of LOC92573 (Accession XM_045884). Accordingly, utilities of VGAM306 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92573. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 307 (VGAM307) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9059] VGAM307 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM307 was detected is described hereinabove with reference to Figs. 1-8.

[9060] VGAM307 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9061] VGAM307 gene encodes a VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM307 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM307 precursor RNA is designated SEQ ID:293, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:293 is located at position 10139 relative to the genome of Vaccinia Virus.

[9062] VGAM307 precursor RNA folds onto itself, forming VGAM307 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nu-

cleotide sequence of the second half thereof.

[9063] An enzyme complex designated DICER COMPLEX, `dices` the VGAM307 folded precursor RNA into VGAM307 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 87%) nucleotide sequence of VGAM307 RNA is designated SEQ ID:642, and is provided hereinbelow with reference to the sequence listing part.

[9064] VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM307 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9065] VGAM307 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM307 host target

RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM307 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM307 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9066] The complementary binding of VGAM307 RNA, herein designated VGAM RNA, to host target binding sites on VGAM307 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and

BINDING SITE III, inhibits translation of VGAM307 host target RNA into VGAM307 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9067] It is appreciated that VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM307 host target genes. The mRNA of each one of this plurality of VGAM307 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM307 RNA, herein designated VGAM RNA, and which when bound by VGAM307 RNA causes inhibition of translation of respective one or more VGAM307 host target proteins.

[9068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM307 gene, herein designated VGAM GENE, on one or more VGAM307 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated

only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9069] It is yet further appreciated that a function of VGAM307 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM307 correlate with, and may be deduced from, the identity of the host target genes which VGAM307 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9070] Nucleotide sequences of the VGAM307 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM307 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM307 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM307 are further described hereinbelow with reference to Table 1.

[9071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM307 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM307 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9072] As mentioned hereinabove with reference to Fig. 1, a function of VGAM307 gene, herein designated VGAM is inhibition of expression of VGAM307 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM307 correlate with, and may be deduced from, the identity of the target genes which VGAM307 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9073] Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180) is a VGAM307 host target gene. NTRK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NTRK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of NTRK2 BINDING SITE, designated SEQ ID:1275, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9074] A function of VGAM307 is therefore inhibition of Neurotrophic Tyrosine Kinase, Receptor, Type 2 (NTRK2, Accession NM_006180), a gene which is involved in the development and/or maintenance of the nervous system. Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTRK2. The function of NTRK2 has been established by previous studies. Nakagawara et al. (1995) isolated cDNAs spanning the entire coding region of both human full-length and truncated forms of TRKB from human brain cDNA libraries. The full-length TRKB coded for a protein of 822 amino acid residues. The putative mature peptide sequence was 49% and 55% homologous to human NTRK1 and NTRK3, respectively. Nine of 13 cysteine residues, 4 of 12 N-glycosylation sites in the extracellular domain, and 10 of 13 tyrosine residues in the intracellular domain are conserved among NTRK1, NTRK2, and NTRK3. Two major sizes of NTRK2 transcripts were expressed in

human brain. Animal model experiments lend further support to the function of NTRK2. To study the function of TRKB in the cerebellum, Rico et al. (2002) deleted the *Trkb* gene in mouse cerebellar precursors by Wnt1-driven Cre-mediated recombination. Despite the absence of *Trkb*, the mature cerebellum of mutant mice appeared similar to that of wildtype, with all types of cells present in normal numbers and positions. Granule and Purkinje cell dendrites appeared normal, and the former had typical numbers of excitatory synapses. By contrast, inhibitory interneurons were strongly affected. Although present in normal number, inhibitory interneurons exhibited reduced amounts of GABAergic markers and developed reduced numbers of GABAergic boutons and synaptic specializations. Thus, Rico et al. (2002) concluded that TRKB is essential to the development of GABAergic neurons and regulates synapse formation in addition to its role in the development of axon terminals.

[9075] It is appreciated that the abovementioned animal model for NTRK2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9076] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [9077] Nakagawara, A.; Liu, X.-G.; Ikegaki, N.; White, P. S.; Yamashiro, D. J.; Nycum, L. M.; Biegel, J. A.; Brodeur, G. M. : Cloning and chromosomal localization of the human TRK-B tyrosine kinase receptor gene (NTRK2). *Genomics* 25: 538–546, 1995. ; and
- [9078] Rico, B.; Xu, B.; Reichardt, L. F. : TrkB receptor signaling is required for establishment of GABAergic synapses in the cerebellum. *Nature Neurosci.* 5: 225–233, 2002.
- [9079] Further studies establishing the function and utilities of NTRK2 are found in John Hopkins OMIM database record ID 600456, and in cited publications numbered 407–409, 2972–35 and 2957 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inhibitor of Growth Family, Member 3 (ING3, Accession NM_019071) is another VGAM307 host target gene. ING3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ING3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ING3 BINDING SITE, designated SEQ ID:1879,

to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9080] Another function of VGAM307 is therefore inhibition of Inhibitor of Growth Family, Member 3 (ING3, Accession NM_019071). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ING3. KIAA1164 (Accession XM_045358) is another VGAM307 host target gene. KIAA1164 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1164 BINDING SITE, designated SEQ ID:2861, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9081] Another function of VGAM307 is therefore inhibition of KIAA1164 (Accession XM_045358). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1164. LOC150577 (Accession XM_097918) is another VGAM307 host target gene. LOC150577 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150577 BINDING SITE, designated SEQ ID:3328, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9082] Another function of VGAM307 is therefore inhibition of LOC150577 (Accession XM_097918). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150577. LOC199936 (Accession XM_117158) is another VGAM307 host target gene. LOC199936 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC199936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199936 BINDING SITE, designated SEQ ID:3474, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9083] Another function of VGAM307 is therefore inhibition of

LOC199936 (Accession XM_117158). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199936. LOC257235 (Accession XM_173124) is another VGAM307 host target gene. LOC257235 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257235 BINDING SITE, designated SEQ ID:3727, to the nucleotide sequence of VGAM307 RNA, herein designated VGAM RNA, also designated SEQ ID:642.

[9084] Another function of VGAM307 is therefore inhibition of LOC257235 (Accession XM_173124). Accordingly, utilities of VGAM307 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257235. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 308 (VGAM308) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[9085] VGAM308 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM308 was detected is described hereinabove with reference to Figs. 1–8.

[9086] VGAM308 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9087] VGAM308 gene encodes a VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM308 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM308 precursor RNA is designated SEQ ID:294, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:294 is located at position 9119 relative to the genome of Vaccinia Virus.

[9088] VGAM308 precursor RNA folds onto itself, forming VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9089] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM308 folded precursor RNA into VGAM308 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 83%) nucleotide se-
quence of VGAM308 RNA is designated SEQ ID:643, and is
provided hereinbelow with reference to the sequence list-
ing part.

[9090] VGAM308 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM308 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM308 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9091] VGAM308 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM308 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM308 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[9092] The complementary binding of VGAM308 RNA, herein designated VGAM RNA, to host target binding sites on VGAM308 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM308 host target RNA into VGAM308 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9093] It is appreciated that VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM308 host target genes. The mRNA of each one of this plurality of VGAM308 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM308 RNA, herein designated VGAM RNA, and which when bound by VGAM308 RNA causes inhibition of translation of respective one or more VGAM308 host target proteins.

[9094] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM308 gene, herein designated VGAM GENE, on one or

more VGAM308 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9095] It is yet further appreciated that a function of VGAM308 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM308 correlate with, and may be deduced from, the identity of the host target genes which VGAM308 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9096] Nucleotide sequences of the VGAM308 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM308 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM308 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM308 are further described hereinbelow with reference to Table 1.
- [9097] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM308 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM308 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9098] As mentioned hereinabove with reference to Fig. 1, a function of VGAM308 gene, herein designated VGAM is inhibition of expression of VGAM308 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM308 correlate with, and may be deduced from, the identity of the target genes which VGAM308 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [9099] Collagen, Type XIX, Alpha 1 (COL19A1, Accession

NM_001858) is a VGAM308 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:863, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9100] A function of VGAM308 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 has been established by previous studies. The collagens are a large superfamily of genes that include a number of subgroups. One such group is composed of fibrillar associated collagens with interrupted triple helices (FACIT) and includes collagen types IX (e.g., 120210), XII (e.g., 120320), XIV (e.g., 120324), and XVI (e.g., 120326). Members of this group

have common structural features, including short stretches of collagenous domains interrupted by non-collagenous regions. These, in turn, form functional units that serve to produce adhesion to the fibrils, provide a rigid arm that projects from the fibril and provide a point of interaction with other matrix components Yoshioka et al. (1992) mapped the COL19A1 gene to 6q12-q14, where the COL9A1 gene (OMIM Ref. No. 120210) has been mapped. Myers et al. (1993) mapped the COL19A1 gene to chromosome 6 by analysis of a panel of somatic cell hybrids. By FISH, Gerecke et al. (1997) mapped the COL19A1 gene to 6q12-q13. Khaleduzzaman et al. (1997) showed that the mouse Col19a1 gene is located on chromosome 1A3, where Col9a1 had also been mapped. They suggested that COL19A1 and COL9A1, and their murine counterparts, were duplicated from the same ancestral gene of the FACIT family

[9101] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9102] Yoshioka, H.; Zhang, H.; Ramirez, F.; Mattei, M.-G.; Moradi-Ameli, M.; van der Rest, M.; Gordon, M. K. : Synteny between the loci for a novel FACIT-like collagen

(D6S228E) and alpha 1(IX) collagen (COL9A1) on 6q12-q14 in humans. Genomics 13: 884-886, 1992. ; and

- [9103] Yoshioka, H.; Zhang, H.; Ramirez, F.; Mattei, M.-G.; Moradi-Ameli, M.; van der Rest, M.; Gordon, M. K. : Synteny between the loci for a novel FACIT-like collagen (D6S228E) and alpha 1(IX).
- [9104] Further studies establishing the function and utilities of COL19A1 are found in John Hopkins OMIM database record ID 120165, and in cited publications numbered 841-840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM_004105) is another VGAM308 host target gene. EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by EFEMP1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFEMP1 BINDING SITE1 and EFEMP1 BINDING SITE2, designated SEQ ID:1089 and SEQ ID:1864 respectively, to the nucleotide sequence of VGAM308 RNA,

herein designated VGAM RNA, also designated SEQ ID:643.

[9105] Another function of VGAM308 is therefore inhibition of EGF-containing Fibulin-like Extracellular Matrix Protein 1 (EFEMP1, Accession NM_004105). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EFEMP1. Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM_004494) is another VGAM308 host target gene. HDGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HDGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDGF BINDING SITE, designated SEQ ID:1120, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9106] Another function of VGAM308 is therefore inhibition of Hepatoma-derived Growth Factor (high-mobility group protein 1-like) (HDGF, Accession NM_004494), a gene which is a heparin-binding protein, with mitogenic activity for fibroblasts. Accordingly, utilities of VGAM308 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with HDGF. The function of HDGF has been established by previous studies. Nakamura et al. (1994) purified a novel hepatoma-derived growth factor from the conditioned medium of human hepatoma-derived cell line HuH-7. Molecular cloning of a cDNA from the cDNA library of the same cell line was done on the basis of the N-terminal amino acid sequence. The cDNA was 2.4 kb long and the deduced amino acid sequence contained 240 amino acids without a signal peptide-like N-terminal hydrophobic sequence. The primary sequence shared homology with the high mobility group-1 protein (OMIM Ref. No. 163905); they showed 23.4% amino acid identity and 35.6% amino acid similarity. Immunofluorescence study showed that HDGF is localized in the cytoplasm of hepatoma cells and northern blots showed that it is expressed ubiquitously in normal tissues and tumor cell lines. Nakamura et al. (1994) suggested that it is a novel heparin-binding protein with mitogenic activity for fibroblasts. HDGF is ubiquitously expressed in normal tissues and tumor cell lines. By PCR screening of a commercial monochromosomal hybrid panel, Wanschura et al. (1996) mapped HDGF to the X chromosome. By fluo-

rescence in situ hybridization, they determined the sub-chromosomal localization to be Xq25. Whereas a major group of the HMG protein family has been mapped to chromosomal segments frequently involved in the tumorigenesis of benign solid tumors, no tumor association for the Xq25 region was known.

[9107] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9108] Nakamura, H.; Izumoto, Y.; Kambe, H.; Kuroda, T.; Mori, T.; Kawamura, K.; Yamamoto, H.; Kishimoto, T. : Molecular cloning of complementary DNA for a novel human hepatoma-derived growth factor: its homology with high mobility group-1 protein. J. Biol. Chem. 269: 25143-25149, 1994. ; and

[9109] Wanschura, S.; Schoenmakers, E. F. P. M.; Huysmans, C.; Bartnitzke, S.; Van de Ven, W. J. M.; Bullerdiek, J. : Mapping of the gene encoding the human hepatoma-derived growth factor (HDG.

[9110] Further studies establishing the function and utilities of HDGF are found in John Hopkins OMIM database record ID 300043, and in cited publications numbered 1998-1999 listed in the bibliography section hereinbelow, which are

also hereby incorporated by reference. Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542) is another VGAM308 host target gene. HGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HGF BINDING SITE, designated SEQ ID:3642, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9111] Another function of VGAM308 is therefore inhibition of Hepatocyte Growth Factor (hepapoietin A; scatter factor) (HGF, Accession XM_168542), a gene which may be required for normal embryonic development; strongly similar to murine Hgf, has kringle domains. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HGF. The function of HGF has been established by previous studies. Kilby et al. (1996) found that the protein and mRNA for both hepatocyte growth factor and its receptor (MET) are present in third trimester placentas, suggesting that HGF serves as a paracrine mediator to control placen-

tal development and growth. B cells develop in the bone marrow from progenitor cells that have been designated pre-pro-B cells, pro-B cells (no immunoglobulin, or Ig, chains chosen), pre-B cells (which have selected a heavy chain but not a light chain), and finally B cells (which express both heavy and light chains of the Ig molecule). Differentiation of pre-pro-B cells to pro-B cells requires signaling through IL7 receptor (IL7R; 146661) mediated by the pre-pro-B cell growth-stimulating factor (PPBSF), which consists of IL7 (OMIM Ref. No. 146660) and a 30-kD protein cofactor. By amino acid sequencing and RT-PCR analysis, Lai and Goldschneider (2001) determined that the PPBSF cofactor is the 30-kD beta chain of HGF (HGFB) produced independently of the 60-kD alpha chain of HGF. Formation of an IL7-HGFB heterodimer requires the presence of heparin sulfate. Functional analysis indicated that either IL7 or HGFB can maintain the viability of pre-pro-B cells, but only the heterodimer can stimulate their proliferation and differentiation into pro-B cells. Lai and Goldschneider (2001) concluded that PPBSF is a novel form of cytokine, a hybrid cytokine, consisting of the bioactive components of 2 unrelated cytokines. They proposed that through its heparin-binding and mitogenic

properties, HGFB enables IL7 to participate in cognate interactions at the stromal cell surface and transduce signals effectively at low levels of IL7R. Animal model experiments lend further support to the function of HGF.

Schmidt et al. (1995) and Uehara et al. (1995) produced targeted disruption of the HGF gene in mice and found that mice lacking the gene product fail to develop completely and die in utero. The mutation affects the embryonic liver, which is reduced in size and shows extensive loss of parenchymal cells. In addition, development of the placenta, particularly of trophoblast cells, is impaired.

HGF/SF is thought to mediate a signal exchange between the mesenchyme and epithelia during mouse development. Both the HGF gene and the gene for its receptor, the product of the MET protooncogene, are expressed in many tissues during embryonic development and in the adult. The findings of these studies indicate that HGF/SF is an essential mediator of allantoic mesenchyme-trophoblastic epithelia interaction required for placental organogenesis.

[9112] It is appreciated that the abovementioned animal model for HGF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

- [9113] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9114] Lai, L.; Goldschneider, I. : Cutting edge: identification of a hybrid cytokine consisting of IL-7 and the beta-chain of the hepatocyte growth factor/scatter factor. J. Immun. 167: 3550-3554, 2001. ; and
- [9115] Schmidt, C.; Bladt, F.; Goedecke, S.; Brinkmann, V.; Zschiesche, W.; Sharpe, M.; Gherardi, E.; Birchmeier, C. : Scatter factor/hepatocyte growth factor is essential for liver development.
- [9116] Further studies establishing the function and utilities of HGF are found in John Hopkins OMIM database record ID 142409, and in sited publications numbered 2607-2610, 608, 2611-262 and 2923-2623 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM_003204) is another VGAM308 host target gene. NFE2L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFE2L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFE2L1 BINDING SITE, designated SEQ ID:999, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9117] Another function of VGAM308 is therefore inhibition of Nuclear Factor (erythroid-derived 2)-like 1 (NFE2L1, Accession NM_003204), a gene which may regulate expression of ferritin genes. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFE2L1. The function of NFE2L1 has been established by previous studies. Chan et al. (1993) devised a complementation assay in yeast to clone mammalian transcription activators and used it to identify a distinct human bZIP transcription factor, NFE2L1, which they designated NRF1 (NFE2-related factor-1) because of its similarities to NFE2 (OMIM Ref. No. 601490). Chan et al. (1995) showed that the NFE2L1 gene encodes a 742-amino acid protein with a different molecular weight than either the p45 subunit (NFE2) or the Maf protein subunit (MafF, MafG (OMIM Ref. No. 602020), or MafK (OMIM Ref. No. 600197)) of nuclear factor erythroid-2. Chan et al. (1993) found that NFE2L1 ac-

tivates transcription via NFE2-binding sites in yeast cells. The ubiquitous expression pattern of NFE2L1 and the range of promoters containing the NFE2-binding motif suggested that this gene may play a role in the regulation of heme synthesis and ferritin genes. Animal model experiments lend further support to the function of NFE2L1. To determine the function of Nrf1, Chan et al. (1998) disrupted the mouse gene by homologous recombination. Heterozygous Nrf1 mutant mice developed normally, were fertile, and showed no obvious abnormalities. Mice homozygous for the Nrf1 mutation suffered from anemia as a result of abnormal fetal liver erythropoiesis and died in utero at mid-late gestation. The authors did not detect defects in globin gene expression. Abnormal red cell production appeared to result from a defect in the fetal liver microenvironment specific for erythroid cells. Chan et al. (1998) suggested that target genes regulated by Nrf1 play an essential role during fetal liver hematopoiesis.

[9118] It is appreciated that the abovementioned animal model for NFE2L1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9119] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [9120] Chan, J. Y.; Kwong, M.; Lu, R.; Chang, J.; Wang, B.; Yen, T. S. B.; Kan, Y. W. : Targeted disruption of the ubiquitous CNC-bZIP transcription factor, Nrf-1, results in anemia and embryonic lethality in mice. EMBO J. 17: 1779-1787, 1998. ; and
- [9121] Chan, J. Y.; Han, X.-L.; Kan, Y. W. : Cloning of Nrf1, an NF-E2-related transcription factor, by genetic selection in yeast. Proc. Nat. Acad. Sci. 90: 11371-11375, 1993.
- [9122] Further studies establishing the function and utilities of NFE2L1 are found in John Hopkins OMIM database record ID 163260, and in cited publications numbered 2410-2416 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Neuroligin 1 (NLGN1, Accession NM_014932) is another VGAM308 host target gene. NLGN1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NLGN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NLGN1 BINDING SITE, designated SEQ ID:1592, to the nucleotide se-

quence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9123] Another function of VGAM308 is therefore inhibition of Neuroligin 1 (NLGN1, Accession NM_014932), a gene which may trigger the de novo formation of presynaptic structure. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NLGN1. The function of NLGN1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM308 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:1232, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9124] Another function of VGAM308 is therefore inhibition of

Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 has been established by previous studies. At physiologic pH, prostaglandins (PGs) traverse biologic membranes poorly. Accordingly, PG transport is carrier-mediated in many tissues, including the lung, choroid plexus, liver, anterior chamber of the eye, vagina and uterus, and placenta. Kanai et al. (1995) cloned the rat prostaglandin transporter (symbolized PGT by them) and postulated 3 possible roles for the transporter. First, PGT might mediate the efflux of newly synthesized PGs from cells. Second, PGT might mediate epithelial PG transport. A third possible role of PGT is that of mediating PG clearance and degradation. Lu et al. (1996) favored the clearance role for PGT. Using a rat PGT probe on Northern blots of human kidney mRNA, they found evidence for the presence of a human PGT homolog. They screened a human kidney cDNA library and isolated human PGT. The gene encodes a 643-amino acid polypeptide with 82% identity to the rat protein. They expressed a

full-length human cDNA clone in cultured cells and reported that both rat and human PGT transport PGD₂, as well as PGE₁, PGE₂, and PGF_{2a}. Although human PGT has cDNA and deduced amino acid sequences similar to those of the rat, the tissue distribution of mRNA transcripts is substantially broader in human. Additionally, the diversity of human PGT transcripts is greater and the affinity for thromboxane-2 is greater. Lu et al. (1996) found strong PGT mRNA expression in the human fetus. By PCR-based monochromosomal somatic cell hybrid mapping and fluorescence in situ hybridization, Lu and Schuster (1998) mapped the PGT gene to 3q21.

[9125] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9126] Kanai, N.; Lu, R.; Satriano, J. A.; Bao, Y.; Wolkoff, A. W.; Schuster, V. L. : Identification and characterization of a prostaglandin transporter. *Science* 268: 866–869, 1995. ; and

[9127] Lu, R.; Kanai, N.; Bao, Y.; Schuster, V. L. : Cloning, in vitro expression, and tissue distribution of a human prostaglandin transporter cDNA (hPGT). *J. Clin. Invest.* 98: 1142–1149, 1996.

[9128] Further studies establishing the function and utilities of SLC21A2 are found in John Hopkins OMIM database record ID 601460, and in cited publications numbered 657–659 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FHR5 (Accession NM_030787) is another VGAM308 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:2166, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9129] Another function of VGAM308 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. FLJ13710 (Accession NM_024817) is another VGAM308 host target gene. FLJ13710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13710 BINDING SITE, designated SEQ ID:2091, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9130] Another function of VGAM308 is therefore inhibition of FLJ13710 (Accession NM_024817). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13710. KIAA1155 (Accession XM_030864) is another VGAM308 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:2628, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9131] Another function of VGAM308 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1155. SEF (Accession XM_045300) is another VGAM308 host target gene. SEF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEF BINDING SITE, designated SEQ ID:2860, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9132] Another function of VGAM308 is therefore inhibition of SEF (Accession XM_045300). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEF. Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627) is another VGAM308 host target gene. TREX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TREX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TREX1 BINDING SITE, designated SEQ ID:2337, to the nucleotide sequence of VGAM308 RNA, herein des-

ignated VGAM RNA, also designated SEQ ID:643.

[9133] Another function of VGAM308 is therefore inhibition of Three Prime Repair Exonuclease 1 (TREX1, Accession NM_033627). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TREX1. Tripartite Motif-containing 6 (TRIM6, Accession NM_058166) is another VGAM308 host target gene. TRIM6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM6 BINDING SITE, designated SEQ ID:2366, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9134] Another function of VGAM308 is therefore inhibition of Tripartite Motif-containing 6 (TRIM6, Accession NM_058166). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM6. VEST1 (Accession NM_052958) is another VGAM308 host target gene. VEST1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by VEST1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VEST1 BINDING SITE, designated SEQ ID:2349, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9135] Another function of VGAM308 is therefore inhibition of VEST1 (Accession NM_052958). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VEST1. LOC149076 (Accession XM_086415) is another VGAM308 host target gene. LOC149076 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC149076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149076 BINDING SITE, designated SEQ ID:3128, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9136] Another function of VGAM308 is therefore inhibition of LOC149076 (Accession XM_086415). Accordingly, utilities

of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149076. LOC254043 (Accession XM_170800) is another VGAM308 host target gene. LOC254043 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254043, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254043 BINDING SITE, designated SEQ ID:3667, to the nucleotide sequence of VGAM308 RNA, herein designated VGAM RNA, also designated SEQ ID:643.

[9137] Another function of VGAM308 is therefore inhibition of LOC254043 (Accession XM_170800). Accordingly, utilities of VGAM308 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254043. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 309 (VGAM309) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9138] VGAM309 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM309 was detected is described hereinabove with reference to Figs. 1–8.

[9139] VGAM309 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9140] VGAM309 gene encodes a VGAM309 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM309 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM309 precursor RNA is designated SEQ ID:295, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:295 is located at position 177929 relative to the genome of Vaccinia Virus.

[9141] VGAM309 precursor RNA folds onto itself, forming VGAM309 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

‘hairpin structure’, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed–reversed sequence of the nucleotide sequence of the second half thereof.

[9142] An enzyme complex designated DICER COMPLEX, ‘dices’ the VGAM309 folded precursor RNA into VGAM309 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, ‘dicing’ of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 72%) nucleotide sequence of VGAM309 RNA is designated SEQ ID:644, and is provided hereinbelow with reference to the sequence listing part.

[9143] VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM309 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5’ untranslated region, a protein coding region and a 3’ untranslated region, designated 5’UTR, PROTEIN

CODING and 3`UTR respectively.

[9144] VGAM309 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM309 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM309 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9145] The complementary binding of VGAM309 RNA, herein designated VGAM RNA, to host target binding sites on VGAM309 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM309 host target RNA into VGAM309 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9146] It is appreciated that VGAM309 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM309 host target genes. The mRNA of each one of this plurality of VGAM309 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM309 RNA, herein designated VGAM RNA, and which when bound by VGAM309 RNA causes inhibition of translation of respective one or more VGAM309 host target proteins.

[9147] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM309 gene, herein designated VGAM GENE, on one or more VGAM309 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9148] It is yet further appreciated that a function of VGAM309 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM309 correlate with, and may be deduced from, the identity of the host target genes which VGAM309 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9149] Nucleotide sequences of the VGAM309 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM309 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM309 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM309 are further
described hereinbelow with reference to Table 1.

[9150] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM309 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM309 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[9151] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM309 gene, herein designated VGAM is
inhibition of expression of VGAM309 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM309 correlate with, and may be deduced
from, the identity of the target genes which VGAM309
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[9152] BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog
(yeast) (BUB3, Accession NM_004725) is a VGAM309 host

target gene. BUB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BUB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BUB3 BINDING SITE, designated SEQ ID:1149, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9153] A function of VGAM309 is therefore inhibition of BUB3 Budding Uninhibited By Benzimidazoles 3 Homolog (yeast) (BUB3, Accession NM_004725), a gene which has a role in the mitotic spindle checkpoint. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BUB3. The function of BUB3 has been established by previous studies. A feedback control mechanism, or cell cycle checkpoint, delays the onset of anaphase until all the chromosomes are correctly aligned on the mitotic spindle. Mutations in the *S. cerevisiae* BUB and MAD genes abolish this checkpoint, such that mutant cells fail to undergo mitotic arrest in response to spindle damage. The yeast BUB1 (see OMIM Ref. No. 602452) gene encodes a protein kinase

that can bind and phosphorylate BUB3. Mammalian BUB1 localizes to the kinetochore of unaligned chromosomes. To further characterize the role of BUB1 in mitosis, Taylor et al. (1998) searched an EST database to identify the human homolog of BUB3. They identified a partial human BUB3 cDNA and used a PCR strategy to isolate a full-length cDNA. The predicted 328-amino acid human protein shares approximately 34% identity with yeast BUB3. Both proteins contain 4 WD repeats. When expressed in mammalian cells, a chimeric GFP-BUB3 protein localized to kinetochores before chromosome alignment. Using deletion analysis, the authors identified a domain of BUB1 that is required both for binding BUB3 and for kinetochore localization of BUB1. Taylor et al. (1998) reported that a similar domain in BUBR1 (OMIM Ref. No. 602860) mediates binding to BUB3. They suggested that the BUB and MAD proteins may be part of a large protein complex that is recruited to unattached kinetochores and that dissociates from kinetochores upon achieving correct bipolar attachment. Animal model experiments lend further support to the function of BUB3. By gene-targeting techniques, Kalitsis et al. (2000) disrupted the Bub3 gene in mice, which resulted in embryonic lethality prior to day 8.5

postcoitum (pc) in homozygous mutants. Mutant embryos appeared normal at day 3.5 pc but rapidly degenerated. An observed accumulation of mitotic errors suggested that Bub3 is essential for normal mitosis and for early embryonic development in the mouse.

[9154] It is appreciated that the abovementioned animal model for BUB3 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9155] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9156] Kalitsis, P.; Earle, E.; Fowler, K. J.; Choo, K. H. A. : Bub3 gene disruption in mice reveals essential mitotic spindle checkpoint function during early embryogenesis. *Genes Dev.* 14: 2277–2282, 2000. ; and

[9157] Taylor, S. S.; Ha, E.; McKeon, F. : The human homologue of Bub3 is required for kinetochore localization of Bub1 and a Mad3/Bub1–related protein kinase. *J. Cell Biol.* 142: 1–11, 1998.

[9158] Further studies establishing the function and utilities of BUB3 are found in John Hopkins OMIM database record ID 603719, and in cited publications numbered 63 and 1225

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chloride Channel 6 (CLCN6, Accession NM_001286) is another VGAM309 host target gene. CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CLCN6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN6 BINDING SITE1 through CLCN6 BINDING SITE3, designated SEQ ID:815, SEQ ID:1957 and SEQ ID:1958 respectively, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9159] Another function of VGAM309 is therefore inhibition of Chloride Channel 6 (CLCN6, Accession NM_001286), a gene which is a voltage-gated chloride channel. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLCN6. The function of CLCN6 has been established by previous studies. Members of the mammalian CLCN family of voltage-gated chloride channels display differential tissue distribution and perform diverse func-

tions. Nomura et al. (1994) identified a partial human CLCN6 cDNA, which they called KIAA0046. Northern blot analysis revealed that CLCN6 was expressed widely. Using the partial cDNA sequence of Nomura et al. (1994), Brandt and Jentsch (1995) cloned human cerebral cortex cDNAs that covered the entire CLCN6 coding region. The predicted 869-amino acid protein was called CLC6 by them. The amino acid sequence of CLCN6 is 45% identical to that of CLCN7 (OMIM Ref. No. 602727) but only 23 to 29% identical to the sequences of other known CLCNs. Therefore, Brandt and Jentsch (1995) stated that CLCN6 and CLCN7 together define a new branch of the chloride channel protein family. By Northern blot analysis, Brandt and Jentsch (1995) found that CLCN6 was expressed as an approximately 6-kb mRNA in all tissues examined. Eggermont et al. (1997) identified 4 different CLCN6 cDNAs that represent alternatively spliced transcripts. Nomura et al. (1994) mapped the CLCN6 gene to chromosome 1 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Brandt and Jentsch (1995) refined the localization of the CLCN6 gene to 1p36. They noted that 2 genes encoding kidney-specific chloride channels, CLCNKA (OMIM Ref. No. 602024) and CLCNKB (OMIM Ref. No.

602023), also map to 1p36.

[9160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9161] REFERENCES 1. Brandt, S.; Jentsch, T. J. : CLC-6 and CLC-7 are two novel broadly expressed members of the CLC chloride channel family. FEBS Lett. 377: 15-20, 1995. ; and

[9163] Further studies establishing the function and utilities of CLCN6 are found in John Hopkins OMIM database record ID 602726, and in cited publications numbered 1939-194 and 511 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CTP Synthase (CTPS, Accession XM_114141) is another VGAM309 host target gene. CTPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTPS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of CTPS BINDING SITE, designated SEQ ID:3441, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9164] Another function of VGAM309 is therefore inhibition of CTP Synthase (CTPS, Accession XM_114141), a gene which is important in the biosynthesis of phospholipids and nucleic acids. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTPS. The function of CTPS has been established by previous studies. The catalytic conversion of UTP to CTP is accomplished by the enzyme cytidine-5-prime-triphosphate synthetase (UTP:L-glutamine amido ligase; EC 6.3.4.2). The enzyme is important in the biosynthesis of phospholipids and nucleic acids, and plays a key role in cell growth, development, and tumorigenesis. Thomas et al. (1989) isolated a cDNA clone of the CTP synthetase gene from a rat liver cDNA library. It is a key regulatory enzyme in pyrimidine biosynthesis. These authors have isolated both cDNA and genomic gene sequences from the rat and Chinese hamster. Yamauchi et al. (1990) cloned the CTPS gene and showed that the open reading frame encodes 591 amino acids that have a strik-

ing degree of similarity to the structural gene in *E. coli* Yamauchi et al. (1991) assigned the structural gene to 1p by study of a panel of human/rodent somatic cell hybrids and the CTPS cDNA. By a method of mapping that combines fluorescence in situ hybridization with replicated prometaphase R-bands (Takahashi et al., 1990), Takahashi et al. (1991) mapped the CTPS gene to 1p34.3–p34.1. By high-resolution banding analysis, they further narrowed the assignment to 1p34.1; see Yamauchi et al. (1991). The genomic sequence is distributed in 19 exons covering about 35 kb. Mutations eliminating the feedback regulation of CTPS result in multidrug resistance and mutator phenotype in Chinese hamster ovary (CHO) cells. The region to which the CTPS gene has been mapped is the location of breakpoints involved in several tumor types. Yamauchi et al. (1993) found that inactivating mutations clustered in a highly conserved region of the gene make it feasible to assess the role of such mutations in the development of drug resistance encountered in the treatment of malignant disease and not readily explained by altered expression of the multidrug resistance genes (e.g., 171050).

[9165] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [9166] Yamauchi, M.; Yamauchi, N.; Phear, G.; Spurr, N. K.; Martinsson, T.; Weith, A.; Meuth, M. : Genomic organization and chromosomal localization of the human CTP synthetase gene (CTPS). *Genomics* 11: 1088–1096, 1991. ; and
- [9167] Whelan, J.; Phear, G.; Yamauchi, M.; Meuth, M. : Clustered base substitutions in CTP synthetase conferring drug resistance in Chinese hamster ovary cells. *Nature Genet.* 3: 317–322, 1993.
- [9168] Further studies establishing the function and utilities of CTPS are found in John Hopkins OMIM database record ID 123860, and in cited publications numbered 3061–3066, and 897 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641) is another VGAM309 host target gene. RB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of RB1 BINDING SITE, designated SEQ ID:3505, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9169] Another function of VGAM309 is therefore inhibition of Retinoblastoma 1 (including osteosarcoma) (RB1, Accession XM_165641), a gene which probably acts as a regulator of other genes. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RB1. The function of RB1 has been established by previous studies. Retinoblastoma (RB) is an embryonic neoplasm of retinal origin. It almost always presents in early childhood and is often bilateral. Spontaneous regression (OMIM Ref. No. 'cure') occurs in some cases. Connolly et al. (1983) reported a 4-generation family with 3 patterns of expression of the retinoblastoma gene: frank retinoblastoma, unilateral or bilateral; retinoma; and no visible retinal pathology except for 'normal degeneration' with age. ('Paving stone degeneration' of the type observed in 2 of 3 RB carriers, aged 49 and 59, is said by Duane (1980) to occur in about 20% of the adult population.) Gallie and Phillips (1982) described benign lesions in the retina in retinoblastoma patients. The distinctive characteristics of these lesions, referred to

by the authors as retinomas, included a translucent, grayish retinal mass protruding into the vitreous, 'cottage-cheese' calcification in 75%, and retinal pigment epithelial migration and proliferation in 60%. They suggested that retinomas represent not the heterozygous state postulated by the Knudson 2-stage model of carcinogenesis but rather the homozygous state occurring in differentiated cell(s). Gallie et al. (1982) suggested that retinomas represent either spontaneous regression of a retinoblastoma or a benign manifestation of the RB gene. Animal model experiments lend further support to the function of RB1. Windle et al. (1990) created transgenic mice by microinjecting fertilized ova with a chimeric gene containing the protein coding region of the SV40 T antigen (Tag) driven by the promoter of the luteinizing hormone beta-subunit gene. One of the male founders developed bilateral retinoblastomas at about age 5 months. The phenotype was heritable with complete penetrance in transgenic offspring in whom the tumors were first observed at about 2 months. Windle et al. (1990) demonstrated specific association between p105(Rb) and T antigen in mouse retinoblastoma tumor cells. Thus, evidence is provided for oncogenesis due to the ocular-specific expression of an

Rb-binding oncoprotein that can functionally inactivate the Rb protein.

- [9170] It is appreciated that the abovementioned animal model for RB1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [9171] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9172] Connolly, M. J.; Payne, R. H.; Johnson, G.; Gallie, B. L.; Alderdice, P. W.; Marshall, W. H.; Lawton, R. D. : Familial, EsD-linked, retinoblastoma with reduced penetrance and variable expressivity. Hum. Genet. 65: 122-124, 1983. ; and
- [9173] Gallie, B. L.; Ellsworth, R. M.; Abramson, D. M.; Phillips, R. A. : Retinoma: spontaneous regression of retinoblastoma or benign manifestation of the mutation? Brit. J. Cancer 45: 513-5.
- [9174] Further studies establishing the function and utilities of RB1 are found in John Hopkins OMIM database record ID 180200, and in cited publications numbered 2549-2560, 2281-2282, 7-13, 545-565, 1125-571, 150-156, 1060-160, 737-175, 1297-1309, 3 and 1310-1317

listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915) is another VGAM309 host target gene. RP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP2 BINDING SITE, designated SEQ ID:1339, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9175] Another function of VGAM309 is therefore inhibition of Retinitis Pigmentosa 2 (X-linked recessive) (RP2, Accession NM_006915). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP2. Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331) is another VGAM309 host target gene. WHSC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WHSC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of WHSC1 BINDING SITE, designated SEQ ID:1394, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9176] Another function of VGAM309 is therefore inhibition of Wolf-Hirschhorn Syndrome Candidate 1 (WHSC1, Accession NM_007331), a gene which binds covalently to and repairs g/t mismatches. Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WHSC1. The function of WHSC1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM234. ARHGAP11A (Accession NM_014783) is another VGAM309 host target gene. ARHGAP11A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGAP11A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP11A BINDING SITE, designated SEQ ID:1546, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9177] Another function of VGAM309 is therefore inhibition of ARHGAP11A (Accession NM_014783). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP11A. FLJ20533 (Accession NM_017866) is another VGAM309 host target gene. FLJ20533 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20533 BINDING SITE, designated SEQ ID:1758, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9178] Another function of VGAM309 is therefore inhibition of FLJ20533 (Accession NM_017866). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20533. MGC16063 (Accession NM_053047) is another VGAM309 host target gene. MGC16063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16063 BINDING SITE, designated SEQ ID:2356, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9179] Another function of VGAM309 is therefore inhibition of MGC16063 (Accession NM_053047). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16063. Sema Domain, Immunoglobulin Domain (Ig), Short Basic Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379) is another VGAM309 host target gene. SEMA3C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEMA3C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEMA3C BINDING SITE, designated SEQ ID:1293, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9180] Another function of VGAM309 is therefore inhibition of Sema Domain, Immunoglobulin Domain (Ig), Short Basic

Domain, Secreted, (semaphorin) 3C (SEMA3C, Accession NM_006379). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEMA3C. LOC135293 (Accession XM_072402) is another VGAM309 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:3047, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9181] Another function of VGAM309 is therefore inhibition of LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. LOC153883 (Accession XM_087798) is another VGAM309 host target gene. LOC153883 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153883, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153883 BINDING SITE, designated SEQ ID:3182, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9182] Another function of VGAM309 is therefore inhibition of LOC153883 (Accession XM_087798). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153883. LOC199692 (Accession NM_145295) is another VGAM309 host target gene. LOC199692 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199692, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199692 BINDING SITE, designated SEQ ID:2521, to the nucleotide sequence of VGAM309 RNA, herein designated VGAM RNA, also designated SEQ ID:644.

[9183] Another function of VGAM309 is therefore inhibition of LOC199692 (Accession NM_145295). Accordingly, utilities of VGAM309 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC199692. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 310 (VGAM310) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9184] VGAM310 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM310 was detected is described hereinabove with reference to Figs. 1–8.

[9185] VGAM310 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9186] VGAM310 gene encodes a VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM310 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM310 precursor RNA is designated SEQ ID:296, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:296 is located at position 9389 relative to the genome of Vaccinia Virus.

[9187] VGAM310 precursor RNA folds onto itself, forming VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9188] An enzyme complex designated DICER COMPLEX, `dices` the VGAM310 folded precursor RNA into VGAM310 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 70%) nucleotide sequence of VGAM310 RNA is designated SEQ ID:645, and is provided hereinbelow with reference to the sequence listing part.

[9189] VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM310 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM310 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9190] VGAM310 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM310 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM310 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9191] The complementary binding of VGAM310 RNA, herein designated VGAM RNA, to host target binding sites on VGAM310 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM310 host target RNA into VGAM310 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9192] It is appreciated that VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM310 host target genes. The mRNA of each one of this plurality of VGAM310 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM310 RNA, herein designated VGAM RNA, and which when bound by VGAM310 RNA causes inhibition of translation of respective one or more VGAM310 host target proteins.

[9193] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM310 gene, herein designated VGAM GENE, on one or more VGAM310 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9194] It is yet further appreciated that a function of VGAM310 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM310 correlate with, and may be deduced from, the identity of the host

target genes which VGAM310 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9195] Nucleotide sequences of the VGAM310 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM310 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM310 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM310 are further described hereinbelow with reference to Table 1.
- [9196] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM310 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM310 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9197] As mentioned hereinabove with reference to Fig. 1, a function of VGAM310 gene, herein designated VGAM is inhibition of expression of VGAM310 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM310 correlate with, and may be deduced from, the identity of the target genes which VGAM310

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9198] MGC5242 (Accession NM_024033) is a VGAM310 host target gene. MGC5242 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC5242, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5242 BINDING SITE, designated SEQ ID:2042, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:645.

[9199] A function of VGAM310 is therefore inhibition of MGC5242 (Accession NM_024033). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5242. LOC197259 (Accession XM_113849) is another VGAM310 host target gene. LOC197259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC197259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC197259 BINDING SITE, designated SEQ ID:3422, to the nucleotide sequence of VGAM310 RNA, herein designated VGAM RNA, also designated SEQ ID:645.

[9200] Another function of VGAM310 is therefore inhibition of LOC197259 (Accession XM_113849). Accordingly, utilities of VGAM310 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197259. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 311 (VGAM311) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9201] VGAM311 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM311 was detected is described hereinabove with reference to Figs. 1–8.

[9202] VGAM311 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9203] VGAM311 gene encodes a VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM311 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM311 precursor RNA is designated SEQ ID:297, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:297 is located at position 176858 relative to the genome of Vaccinia Virus.

[9204] VGAM311 precursor RNA folds onto itself, forming VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9205] An enzyme complex designated DICER COMPLEX, `dices` the VGAM311 folded precursor RNA into VGAM311 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 76%) nucleotide sequence of VGAM311 RNA is designated SEQ ID:646, and is provided hereinbelow with reference to the sequence listing part.

[9206] VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM311 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9207] VGAM311 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM311 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an il-

illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM311 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9208] The complementary binding of VGAM311 RNA, herein designated VGAM RNA, to host target binding sites on VGAM311 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM311 host target RNA into VGAM311 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9209] It is appreciated that VGAM311 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM311 host target genes. The mRNA of each one of this plurality of VGAM311 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM311 RNA, herein designated VGAM RNA, and which when bound by VGAM311 RNA causes inhibition of translation of respective one or more VGAM311 host target proteins.

[9210] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM311 gene, herein designated VGAM GENE, on one or more VGAM311 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these

other miRNA genes have not yet been found (Ruvkun G.,
`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[9211] It is yet further appreciated that a function of VGAM311 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM311 correlate with, and may be deduced from, the identity of the host target genes which VGAM311 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9212] Nucleotide sequences of the VGAM311 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM311 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM311 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM311 are further described hereinbelow with reference to Table 1.

[9213] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM311 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM311 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9214] As mentioned hereinabove with reference to Fig. 1, a function of VGAM311 gene, herein designated VGAM is inhibition of expression of VGAM311 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM311 correlate with, and may be deduced from, the identity of the target genes which VGAM311 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9215] Crystallin, Beta A4 (CRYBA4, Accession NM_001886) is a VGAM311 host target gene. CRYBA4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRYBA4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRYBA4 BINDING SITE, designated SEQ ID:865, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:646.

[9216] A function of VGAM311 is therefore inhibition of Crys-

tallin, Beta A4 (CRYBA4, Accession NM_001886), a gene which is the dominant structural components of the vertebrate eye lens. Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRYBA4. The function of CRYBA4 has been established by previous studies. In the ocular lens, 80 to 90% of the soluble protein fraction comprises crystallins. These proteins are thought to play an important role in the maintenance of the transparency and refractive index of the lens. In the mammalian lens, crystallins can be divided into alpha, beta, gamma, and delta families. These in turn can be subdivided into acidic and basic groups. The beta-A4 gene, an acidic crystallin, was mapped to 22q11.2–q13.1 by van Rens et al. (1991, 1992) by study of somatic cell hybrids including some containing translocated chromosome 22 segments. The CRYBB2 (OMIM Ref. No. 123620) and the CRYBB3 (OMIM Ref. No. 123630) genes have also been assigned to this region of chromosome 22. Hulsebos et al. (1995) demonstrated by interspecific backcross analysis that the homologs of the CRYBB2, CRYBB3, and CRYBA4 genes are located in the central region of mouse chromosome 5. Lampi et al. (1997) cloned the CRYBA4 gene, which they

designated beta-A4, by 3-prime and 5-prime RACE-PCR of lens RNA with primers based on the sequence of bovine CRYBA4. The beta-A4 gene encodes a predicted 196-amino acid protein; the initial methionine is post-translationally removed. The conserved crystallin domain is 92 to 94% identical to rat and bovine beta-A4, and there is an unrelated 10-amino acid N-terminal region ('N-terminal extension'). The calculated 22,285-dalton molecular weight of the protein matched the value determined experimentally by mass spectrometry and by analysis of tryptic peptides. Lampi et al. (1997) found that there are 11 major soluble proteins in the young human lens, and that beta-A4 constitutes approximately 5% of the total

[9217] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9218] Hulsebos, T. J. M.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G. : The beta crystallin genes on human chromosome 22 define a new region of homology with mouse chromosome 5. *Genomics* 25: 574-576, 1995. ; and

[9219] Hulsebos, T. J. M.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G. : The beta crystallin genes on human chromosome

22 define a new region of homology with mouse chromosome 5. Genomics 2.

[9220] Further studies establishing the function and utilities of CRYBA4 are found in John Hopkins OMIM database record ID 123631, and in cited publications numbered 2805–2808 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin Carboxyl-terminal Esterase L1 (ubiquitin thiolesterase) (UCHL1, Accession NM_004181) is another VGAM311 host target gene. UCHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UCHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UCHL1 BINDING SITE, designated SEQ ID:1093, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:646.

[9221] Another function of VGAM311 is therefore inhibition of Ubiquitin Carboxyl-terminal Esterase L1 (ubiquitin thiolesterase) (UCHL1, Accession NM_004181), a gene which is involved both in the processing of ubiquitin precursors and of ubiquinated proteins. Accordingly, utilities of

VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UCHL1. The function of UCHL1 has been established by previous studies. Ubiquitin C-terminal hydrolase L1 represents 1 to 2% of total soluble brain protein (Wilkinson et al., 1989). Its occurrence in Lewy bodies and its function in the proteasome pathway make it a compelling candidate gene in Parkinson disease (OMIM Ref. No. 168600). In a German family with Parkinson disease, Leroy et al. (1998) identified a missense mutation in the UCHL1 gene, ile93 to met (I93M; 191342.0001), which caused a partial loss of the catalytic activity of this thiol protease. They suggested that this could lead to aberrations in the proteolytic pathway and aggregation of proteins. Animal model experiments lend further support to the function of UCHL1. Kurihara et al. (2000) showed that mice homozygous for a targeted deletion of the related Uchl3 gene (OMIM Ref. No. 603090) are indistinguishable from wildtype. To assess whether the 2 hydrolases have redundant function, Kurihara et al. (2001) generated mice homozygous for both Uchl1(gad) and Uchl3(delta3-7). The double homozygotes weighed 30% less than single homozygotes and displayed an earlier onset of lethality, possibly due to dysphagia.

Axonal degeneration of the nucleus tractus solitarius and area postrema of the medulla was noted in these mice. The double homozygotes also displayed a more severe axonal degeneration of the gracile tract of the medulla and spinal cord than had been observed in Uchl1(gad) single homozygotes. In addition, degeneration of dorsal root ganglia cell bodies was detected in both the double homozygotes and Uchl3(delta3-7) single homozygotes. Given that both Uchl1(gad) and Uchl3(delta3-7) single homozygotes displayed distinct degenerative defects that were exacerbated in the double homozygotes, the authors concluded that Uchl1 and Uchl3 may have both separate and overlapping functions in the maintenance of neurons of the gracile tract, nucleus tractus solitarius, and area postrema.

[9222] It is appreciated that the abovementioned animal model for UCHL1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9223] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9224] Kurihara, L. J.; Kikuchi, T.; Wada, K.; Tilghman, S. M. : Loss

of Uch-L1 and Uch-L3 leads to neurodegeneration, posterior paralysis and dysphagia. Hum. Molec. Genet. 10: 1963-1970, 2001. ; and

[9225] Leroy, E.; Boyer, R.; Auburger, G.; Leube, B.; Ulm, G.; Mezey, E.; Harta, G.; Brownstein, M. J.; Jonnalagada, S.; Chernova, T.; Dehejia, A.; Lavedan, C.; Gasser, T.; Steinbach, P. J.; W.

[9226] Further studies establishing the function and utilities of UCHL1 are found in John Hopkins OMIM database record ID 191342, and in cited publications numbered 2958-2970 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BDG-29 (Accession XM_051343) is another VGAM311 host target gene. BDG-29 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BDG-29, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BDG-29 BINDING SITE, designated SEQ ID:2944, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:646.

[9227] Another function of VGAM311 is therefore inhibition of

BDG-29 (Accession XM_051343). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BDG-29. ERG-1 (Accession NM_022034) is another VGAM311 host target gene. ERG-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ERG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERG-1 BINDING SITE, designated SEQ ID:1972, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:646.

[9228] Another function of VGAM311 is therefore inhibition of ERG-1 (Accession NM_022034). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERG-1. LOC199837 (Accession XM_114034) is another VGAM311 host target gene. LOC199837 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC199837, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC199837 BINDING SITE, designated SEQ ID:3434, to the nucleotide sequence of VGAM311 RNA, herein designated VGAM RNA, also designated SEQ ID:646.

[9229] Another function of VGAM311 is therefore inhibition of LOC199837 (Accession XM_114034). Accordingly, utilities of VGAM311 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199837. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 312 (VGAM312) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9230] VGAM312 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM312 was detected is described hereinabove with reference to Figs. 1–8.

[9231] VGAM312 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the

human genome.

[9232] VGAM312 gene encodes a VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM312 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM312 precursor RNA is designated SEQ ID:298, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:298 is located at position 177797 relative to the genome of Vaccinia Virus.

[9233] VGAM312 precursor RNA folds onto itself, forming VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9234] An enzyme complex designated DICER COMPLEX, `dices` the VGAM312 folded precursor RNA into VGAM312 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 74%) nucleotide sequence of VGAM312 RNA is designated SEQ ID:647, and is provided hereinbelow with reference to the sequence listing part.

[9235] VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM312 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9236] VGAM312 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM312 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM312 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9237] The complementary binding of VGAM312 RNA, herein designated VGAM RNA, to host target binding sites on VGAM312 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM312 host target RNA into VGAM312 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9238] It is appreciated that VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM312 host target genes. The mRNA of each one of this plurality of VGAM312 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM312 RNA, herein designated VGAM RNA, and which when bound by VGAM312 RNA causes inhibition of translation of respective one or more VGAM312 host target proteins.

[9239] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM312 gene, herein designated VGAM GENE, on one or more VGAM312 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9240] It is yet further appreciated that a function of VGAM312 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM312 correlate with, and may be deduced from, the identity of the host target genes which VGAM312 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9241] Nucleotide sequences of the VGAM312 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM312 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM312 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM312 are further described hereinbelow with reference to Table 1.

[9242] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM312 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM312 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9243] As mentioned hereinabove with reference to Fig. 1, a function of VGAM312 gene, herein designated VGAM is inhibition of expression of VGAM312 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM312 correlate with, and may be deduced from, the identity of the target genes which VGAM312 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9244] Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762) is a VGAM312 host target gene. BHLHB3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BHLHB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BHLHB3 BINDING SITE, designated SEQ ID:2160, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ

ID:647.

[9245] A function of VGAM312 is therefore inhibition of Basic Helix-loop-helix Domain Containing, Class B, 3 (BHLHB3, Accession NM_030762), a gene which represses both basal and activated transcription. Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BHLHB3. The function of BHLHB3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM127. Ceroid-lipofuscinosis, Neuronal 2, Late Infantile (Jansky-Bielschowsky disease) (CLN2, Accession NM_000391) is another VGAM312 host target gene. CLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLN2 BINDING SITE, designated SEQ ID:735, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9246] Another function of VGAM312 is therefore inhibition of Ceroid-lipofuscinosis, Neuronal 2, Late Infantile

(Jansky–Bielschowsky disease) (CLN2, Accession NM_000391). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLN2. Zinc Finger Protein 36, C3H Type–like 1 (ZFP36L1, Accession NM_004926) is another VGAM312 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:1165, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9247] Another function of VGAM312 is therefore inhibition of Zinc Finger Protein 36, C3H Type–like 1 (ZFP36L1, Accession NM_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 has been established by previous studies. Bustin et al. (1994) cloned and characterized the ZFP36L1 gene, which they

called ERF1, which is a member of the Tis11 family of early-response genes (see OMIM Ref. No. ZFP36; 190700). Members of this gene family contain a distinguishing putative zinc finger domain with a repeating cys-his motif and are induced by various agonists such as the phorbol ester TPA and the polypeptide mitogen EGF (OMIM Ref. No. 131530). The human gene was cloned using a rat homolog as a probe. The rat and human genes have conserved 5-prime and 3-prime UTRs and their promoters contain motifs seen in other early-response genes. The predicted rat and human proteins are 99% identical. Bustin et al. (1994) determined that the ZFP36L1 gene contains 2 exons and spans about 6 kb of genomic DNA including the promoter and UTRs. Ning et al. (1996) also cloned ZFP36L1, which they termed BERG36 (B-cell early response gene encoding a 36-kD protein). The deduced 338-amino acid BERG36 protein could be induced by treatment with calcium ionophore, and the induction could be blocked by treatment with interleukin-4 (IL4; 147780) but not by CD40 (TNFRSF5; 109535) ligation. Treatment of the Epstein-Barr virus-negative human Burkitt lymphoma cell line Ramos, which phenotypically resembles germinal center B cells, with BERG36-antisense

or with IL4 or CD40 ligation protected the cells from ionophore-induced apoptosis. CD40 ligation also protected Ramos cells from apoptosis induced by inhibitors of macromolecular synthesis. Ning et al. (1996) concluded that BERG36 is a target of IL4 signaling for B-cell survival.

[9248] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9249] Bustin, S. A.; Xiao-Feng, N.; Barnard, R. C.; Kumar, V.; Pascall, J. C.; Brown, K. D.; Leigh, I. M.; Williams, N. S.; McKay, I. A. : Cloning and characterisation of ERF1, a human member of the Tis11 family of early-response genes. DNA Cell Biol. 13: 449-459, 1994. ; and

[9250] Ning, Z.-Q.; Norton, J. D.; Li, J.; Murphy, J. J. : Distinct mechanisms for rescue from apoptosis in Ramos human B cells by signaling through CD40 and interleukin-4 receptor: a role for.

[9251] Further studies establishing the function and utilities of ZFP36L1 are found in John Hopkins OMIM database record ID 601064, and in cited publications numbered 1783-1786 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 8 Open Reading Frame 2 (C8orf2, Ac-

cession NM_007175) is another VGAM312 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:1361, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9252] Another function of VGAM312 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. DKFZP566K0524 (Accession XM_045128) is another VGAM312 host target gene. DKFZP566K0524 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP566K0524, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP566K0524 BINDING SITE, designated SEQ ID:2854, to the nucleotide

sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9253] Another function of VGAM312 is therefore inhibition of DKFZP566K0524 (Accession XM_045128). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP566K0524. Fidgetin-like 1 (FIGNL1, Accession NM_022116) is another VGAM312 host target gene. FIGNL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FIGNL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FIGNL1 BINDING SITE, designated SEQ ID:1980, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9254] Another function of VGAM312 is therefore inhibition of Fidgetin-like 1 (FIGNL1, Accession NM_022116). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FIGNL1. FLJ10704 (Accession NM_018185) is another VGAM312 host target gene. FLJ10704 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10704 BINDING SITE, designated SEQ ID:1796, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9255] Another function of VGAM312 is therefore inhibition of FLJ10704 (Accession NM_018185). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10704. HDAC9-PENDING (Accession NM_014707) is another VGAM312 host target gene. HDAC9-PENDING BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDAC9-PENDING, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC9-PENDING BINDING SITE, designated SEQ ID:1528, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9256] Another function of VGAM312 is therefore inhibition of HDAC9–PENDING (Accession NM_014707). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC9–PENDING. KIAA1384 (Accession XM_035405) is another VGAM312 host target gene. KIAA1384 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1384, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1384 BINDING SITE, designated SEQ ID:2695, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9257] Another function of VGAM312 is therefore inhibition of KIAA1384 (Accession XM_035405). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1384. SOX30 (Accession NM_007017) is another VGAM312 host target gene. SOX30 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SOX30, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX30 BINDING SITE, designated SEQ ID:1346, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9258] Another function of VGAM312 is therefore inhibition of SOX30 (Accession NM_007017). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SOX30. LOC221810 (Accession XM_168222) is another VGAM312 host target gene. LOC221810 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221810, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221810 BINDING SITE, designated SEQ ID:3625, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9259] Another function of VGAM312 is therefore inhibition of LOC221810 (Accession XM_168222). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221810. LOC255177 (Accession XM_172941) is another VGAM312 host target gene. LOC255177 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255177, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255177 BINDING SITE, designated SEQ ID:3712, to the nucleotide sequence of VGAM312 RNA, herein designated VGAM RNA, also designated SEQ ID:647.

[9260] Another function of VGAM312 is therefore inhibition of LOC255177 (Accession XM_172941). Accordingly, utilities of VGAM312 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255177. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 313 (VGAM313) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9261] VGAM313 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM313 was detected is described hereinabove with reference to Figs. 1–8.

[9262] VGAM313 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9263] VGAM313 gene encodes a VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM313 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM313 precursor RNA is designated SEQ ID:299, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:299 is located at position 10272 relative to the genome of Vaccinia Virus.

[9264] VGAM313 precursor RNA folds onto itself, forming VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9265] An enzyme complex designated DICER COMPLEX, `dices` the VGAM313 folded precursor RNA into VGAM313 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM313 RNA is designated SEQ ID:648, and is provided hereinbelow with reference to the sequence listing part.

[9266] VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM313 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9267] VGAM313 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM313 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM313 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9268] The complementary binding of VGAM313 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM313 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM313 host target RNA into VGAM313 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9269] It is appreciated that VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM313 host target genes. The mRNA of each one of this plurality of VGAM313 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM313 RNA, herein designated VGAM RNA, and which when bound by VGAM313 RNA causes inhibition of translation of respective one or more VGAM313 host target proteins.

[9270] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM313 gene, herein designated VGAM GENE, on one or more VGAM313 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9271] It is yet further appreciated that a function of VGAM313 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM313 correlate with, and may be deduced from, the identity of the host target genes which VGAM313 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9272] Nucleotide sequences of the VGAM313 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM313 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM313 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM313 are further described hereinbelow with reference to Table 1.

[9273] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM313 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM313 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9274] As mentioned hereinabove with reference to Fig. 1, a function of VGAM313 gene, herein designated VGAM is inhibition of expression of VGAM313 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM313 correlate with, and may be deduced from, the identity of the target genes which VGAM313 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9275] Adrenergic, Alpha-1A-, Receptor (ADRA1A, Accession NM_033303) is a VGAM313 host target gene. ADRA1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADRA1A,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADRA1A BINDING SITE, designated SEQ ID:2327, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9276] A function of VGAM313 is therefore inhibition of Adrenergic, Alpha-1A-, Receptor (ADRA1A, Accession NM_033303). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADRA1A. ADP-ribosylation Factor 3 (ARF3, Accession NM_001659) is another VGAM313 host target gene. ARF3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARF3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARF3 BINDING SITE, designated SEQ ID:845, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9277] Another function of VGAM313 is therefore inhibition of

ADP-ribosylation Factor 3 (ARF3, Accession NM_001659). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF3. Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176) is another VGAM313 host target gene. C14orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C14orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C14orf1 BINDING SITE, designated SEQ ID:1362, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9278] Another function of VGAM313 is therefore inhibition of Chromosome 14 Open Reading Frame 1 (C14orf1, Accession NM_007176). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C14orf1. Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM_004389) is another VGAM313 host target gene. CTNNA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

CTNNA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTNNA2 BINDING SITE, designated SEQ ID:1108, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9279] Another function of VGAM313 is therefore inhibition of Catenin (cadherin-associated protein), Alpha 2 (CTNNA2, Accession NM_004389), a gene which is involved in the cytoplasmic anchorage of cell-cell and cell-substrate adhesion molecules. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTNNA2. The function of CTNNA2 has been established by previous studies. Cell-cell and cell-matrix adhesions involve transmembrane glycoproteins such as cell adhesion molecules and integrins, which are thought to function via interactions of their cytoplasmic domains with proteins associated with the cytoskeleton. Vinculin (OMIM Ref. No. 193065) and talin (OMIM Ref. No. 186745) are examples. The activity of cadherins (e.g., 114020), which mediate homophilic cell-cell Ca^{2+} -dependent association, depends on their an-

chorage to cytoskeleton via proteins termed catenins (Herrenknecht et al., 1991). Animal model experiments lend further support to the function of CTNNA2. Mice homozygous for the 'cerebellar-deficient folia' (cdf) mutation are ataxic and have cerebellar hypoplasia and abnormal lobulation of the cerebellum (Cook et al., 1997). In the cerebella of cdf/cdf homozygous mice, approximately 40% of Purkinje cells are located ectopically in the white matter and inner granule-cell layer. Many hippocampal pyramidal cells are scattered in the plexiform layers, and those that are correctly positioned are less densely packed than are cells in wildtype mice. Park et al. (2002) showed that fear conditioning and prepulse inhibition of the startle response are also disrupted in cdf/cdf mice. They identified a deletion on mouse chromosome 6 that removed approximately 150 kb of the cdf region. The deletion included part of *Catna2*, encoding alpha-N-catenin, a protein that links the classic cadherins to the neuronal cytoskeleton. Expression of a *Catna2* transgene in cdf/cdf mice restored normal cerebellar and hippocampal morphology, prepulse inhibition, and fear conditioning. The findings suggested that catenin-cadherin cell-adhesion complexes are important in cerebellar and hippocampal

lamination and in the control of startle modulation.

[9280] It is appreciated that the abovementioned animal model for CTNNA2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9281] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9282] Claverie, J.-M.; Hardelin, J.-P.; Legouis, R.; Levilliers, J.; Bougueleret, L.; Mattei, M.-G.; Petit, C. : Characterization and chromosomal assignment of a human cDNA encoding a protein related to the murine 102-kDa cadherin-associated protein (alpha-catenin). Genomics 15: 13-20, 1993. ; and

[9284] Further studies establishing the function and utilities of CTNNA2 are found in John Hopkins OMIM database record ID 114025, and in cited publications numbered 2682-2683, 220 and 2684-2685 listed in the bibliography section hereinbelow, which are also hereby incorpo-

rated by reference. FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM_001447) is another VGAM313 host target gene. FAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FAT2 BINDING SITE, designated SEQ ID:829, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9285] Another function of VGAM313 is therefore inhibition of FAT Tumor Suppressor Homolog 2 (Drosophila) (FAT2, Accession NM_001447), a gene which could function as a cell-adhesion protein. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FAT2. The function of FAT2 has been established by previous studies. The domain that characterizes epidermal growth factor (EGF; 131530) consists of approximately 50 amino acids with 3 disulfide bonds. EGF-like domains are believed to play a critical role in a number of extracellular events, including cell adhesion and receptor-ligand interactions. Proteins

with EGF-like domains often consist of more than 1,000 amino acids, have multiple copies of the EGF-like domain, and contain additional domains known to be involved in specific protein-protein interactions. To identify proteins containing EGF-like domains, Nakayama et al. (1998) searched a database of long cDNA sequences randomly selected from a human brain cDNA library for those that encode an EGF-like motif. They identified several partial cDNAs encoding novel proteins with EGF-like domains, such as FAT2, which they named MEGF1. Nakayama et al. (1998) isolated a rat cDNA containing the complete Megf1 coding sequence. The predicted Megf1 protein has a signal sequence, 34 cadherin motifs (see OMIM Ref. No. 603006), a laminin G domain (see OMIM Ref. No. 601033), 2 EGF-like domains, a transmembrane domain, a cytoplasmic proline-rich sequence, and a cytoplasmic RGD (arginine-glycine-aspartic acid) motif, which is found in proteins modulating cell adhesion. The predicted structure of Megf1 is similar overall to the structures of the *Drosophila* 'fat' gene product and human FAT (OMIM Ref. No. 600976), although the number of EGF-like domains varies among these proteins. The *Drosophila* fat gene is a tumor suppressor gene whose product controls cell pro-

liferation and morphogenesis in the imaginal discs in a contact-dependent manner. Northern blot analysis of various regions of rat brain detected Megf1 expression only in the cerebellum.

[9286] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9287] Nakayama, M.; Nakajima, D.; Nagase, T.; Nomura, N.; Seki, N.; Ohara, O. : Identification of high-molecular-weight proteins with multiple EGF-like motifs by motif-trap screening. *Genomics* 51: 27-34, 1998. ; and

[9288] Wu, Q.; Maniatis, T. : Large exons encoding multiple ectodomains are a characteristic feature of protocadherin genes. *Proc. Nat. Acad. Sci.* 97: 3124-3129, 2000.

[9289] Further studies establishing the function and utilities of FAT2 are found in John Hopkins OMIM database record ID 604269, and in cited publications numbered 1672-1673 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM_004482) is another VGAM313 host target gene. GALNT3 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by GALNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT3 BINDING SITE, designated SEQ ID:1118, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9290] Another function of VGAM313 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 3 (GalNAc-T3) (GALNT3, Accession NM_004482), a gene which initiates O-glycosylation of serine and threonine residues. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT3. The function of GALNT3 has been established by previous studies. GALNT3 (EC 2.4.1.41) is one of several enzymes that catalyze the reaction UDP-GalNAc + polypeptide-(Ser/Thr)-OH to GalNAc-alpha-O-Ser/Thr-polypeptide + UDP, thereby initiating O-glycosylation of serine and threonine residues on an array of glycoproteins. Bennett et al. (1996) used degenerate PCR to clone human GALNT3 using primers based on the

sequences of GALNT1 (OMIM Ref. No. 602273) and GALNT2 (OMIM Ref. No. 602274). GALNT3 encodes a 633-amino acid protein which has a single membrane-spanning region and is highly homologous to GALNT1 and GALNT2. Northern blot analysis showed that GALNT3 is expressed as a 3.6-kb transcript, with highest levels in human pancreas and testis. Bennett et al. (1996) expressed the gene in insect Sf9 cells and showed that GALNT3 does have GalNAc-transferase activity, but with different substrate specificity than GALNT1 or GALNT2. The mouse ortholog of GalNAc-T3 was cloned by Zara et al. (1996). Bennett et al. (1998) found that the GALNT1, GALNT2, and GALNT3 genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries are conserved within the 3 genes. By FISH, Bennett et al. (1998) mapped the GALNT3 gene to human chromosome 2q24-q31.

[9291] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9292] Bennett, E. P.; Hassan, H.; Clausen, H. : cDNA cloning and expression of a novel human UDP-N-acetyl-alpha-D-galactosamine. J. Biol. Chem. 271:

17006–17012, 1996. ; and

- [9293] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP–N–acetylgalacto.
- [9294] Further studies establishing the function and utilities of GALNT3 are found in John Hopkins OMIM database record ID 601756, and in cited publications numbered 647–649 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. High–mobility Group 20A (HMG20A, Accession NM_018200) is another VGAM313 host target gene. HMG20A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HMG20A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HMG20A BINDING SITE, designated SEQ ID:1801, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.
- [9295] Another function of VGAM313 is therefore inhibition of High–mobility Group 20A (HMG20A, Accession NM_018200). Accordingly, utilities of VGAM313 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with HMG20A. Hippocalcin (HPCA, Accession NM_002143) is another VGAM313 host target gene. HPCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCA BINDING SITE, designated SEQ ID:903, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9296] Another function of VGAM313 is therefore inhibition of Hippocalcin (HPCA, Accession NM_002143), a gene which may be an hippocampal calcium-binding protein. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCA. The function of HPCA has been established by previous studies. Hippocalcin is a member of a family of neuron-specific $\text{Ca}(2+)$ -binding proteins found in the retina and brain. Hippocalcin is a 23-kD $\text{Ca}(2+)$ -binding protein first identified in the rat hippocampus (Kobayashi et al., 1992). The primary structure of rat hippocalcin comprises 193 amino acid residues and

shows striking sequence similarities to proteins located in the photoreceptor cells that regulate photosignal transduction in a Ca^{2+} -sensitive manner. Hippocalcin is associated with the plasma membrane. Takamatsu et al. (1994) isolated a cDNA clone encoding human hippocalcin from a human hippocampus cDNA library. The human sequence showed 100% amino acid identity with the rat sequence and 92% nucleotide identity. Northern blot analysis detected a single 2.0-kb HPCA transcript only in brain.

[9297] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9298] Kobayashi, M.; Takamatsu, K.; Saitoh, S.; Miura, M.; Noguchi, T. : Molecular cloning of hippocalcin, a novel calcium-binding protein of the recoverin family exclusively expressed in hippocampus. *Biochem. Biophys. Res. Commun.* 189: 511-517, 1992. ; and

[9299] Takamatsu, K.; Kobayashi, M.; Saitoh, S.; Fujishiro, M.; Noguchi, T. : Molecular cloning of human hippocalcin cDNA and chromosomal mapping of its gene. *Biochem. Biophys. Res. Commun.* 20.

[9300] Further studies establishing the function and utilities of HPCA are found in John Hopkins OMIM database record ID

142622, and in cited publications numbered 890–891 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myotubularin Related Protein 3 (MTMR3, Accession NM_021090) is another VGAM313 host target gene. MTMR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTMR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MTMR3 BINDING SITE, designated SEQ ID:1939, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9301] Another function of VGAM313 is therefore inhibition of Myotubularin Related Protein 3 (MTMR3, Accession NM_021090), a gene which could be a tyrosine-phosphatase. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTMR3. The function of MTMR3 has been established by previous studies. Zhao et al. (2001) showed that an isoform of MTMR3, missing exon 17, dephosphorylates para-nitrophenylphosphate and phosphatidylinositol 3-phosphate.

- [9302] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [9305] Further studies establishing the function and utilities of MTMR3 are found in John Hopkins OMIM database record ID 603558, and in cited publications numbered 164 and 1133 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013) is another VGAM313 host target gene. PIGR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PIGR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND–

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGR BINDING SITE, designated SEQ ID:2955, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9306] Another function of VGAM313 is therefore inhibition of Polymeric Immunoglobulin Receptor (PIGR, Accession XM_052013). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGR. Piwi-like 1 (Drosophila) (PIWIL1, Accession XM_052767) is another VGAM313 host target gene. PIWIL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIWIL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIWIL1 BINDING SITE, designated SEQ ID:2959, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9307] Another function of VGAM313 is therefore inhibition of Piwi-like 1 (Drosophila) (PIWIL1, Accession XM_052767). Accordingly, utilities of VGAM313 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with PIWIL1. Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM_015385) is another VGAM313 host target gene. SORBS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SORBS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SORBS1 BINDING SITE, designated SEQ ID:1625, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9308] Another function of VGAM313 is therefore inhibition of Sorbin and SH3 Domain Containing 1 (SORBS1, Accession NM_015385), a gene which necessary for cell polarization during vegetative growth. Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SORBS1. The function of SORBS1 has been established by previous studies. Lin et al. (2001) identified 14 single-nucleotide polymorphisms (SNPs) in the human SH3P12 gene, which they called SORBS1. Studies in 202 nonobese, 113 obese, and 455 subjects with type II diabetes (OMIM Ref. No.

125853) revealed that the alanine allele of a T228A polymorphism in exon 7 exerted a protective role for both obesity (OMIM Ref. No. 601665) (relative risk 0.466; 95% confidence interval 0.265 to 0.821) and diabetes (relative risk 0.668; 95% confidence interval 0.472 to 0.945). Neither allele of the R74W polymorphism was associated with either obesity or diabetes. The authors suggested that the SH3P12 gene may play an important role in the pathogenesis of human disorders with insulin resistance. Insulin stimulates the transport of glucose into fat and muscle cells and initiates its actions by binding to its tyrosine kinase receptor, leading to the phosphorylation of intracellular substrates. One such substrate is the CBL protooncogene product. CBL is recruited to the insulin receptor by interaction with the adaptor protein CAP, through 1 of 3 adjacent SH3 domains in the C terminus of CAP. Upon phosphorylation of CBL, the CAP-CBL complex dissociates from the insulin receptor and moves to a caveolin (see OMIM Ref. No. 601047)-enriched triton-insoluble membrane fraction (Mastick et al., 1995). To identify a molecular mechanism underlying this subcellular redistribution, Baumann et al. (2000) screened a yeast 2-hybrid library using the N-terminal region of CAP and identified the

caveolar protein flotillin (OMIM Ref. No. 131560). Flotillin forms a ternary complex with CAP and CBL, directing the localization of the CAP–CBL complex to a lipid raft subdomain of the plasma membrane. Expression of the N-terminal domain of CAP in 3T3–L1 adipocytes blocks the stimulation of glucose transport by insulin, without affecting signaling events that depend on phosphatidylinositol–3–OH kinase (see OMIM Ref. No. 602838). Thus, localization of the CBL–CAP complex to lipid rafts generates a pathway that is crucial in the regulation of glucose uptake.

[9309] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9310] Lin, W.–H.; Chiu, K. C.; Chang, H.–M.; Lee, K.–C.; Tai, T.–Y.; Chuang, L.–M. : Molecular scanning of the human sorbin and SH3–domain–containing–1 (SORBS1) gene: positive association of the T228A polymorphism with obesity and type 2 diabetes. *Hum. Molec. Genet.* 10: 1753–1760, 2001. ; and

for insul.

[9312] Further studies establishing the function and utilities of SORBS1 are found in John Hopkins OMIM database record ID 605264, and in cited publications numbered 1046, 2780–1141, 250 and 2786 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Topoisomerase (DNA) III Alpha (TOP3A, Accession NM_004618) is another VGAM313 host target gene. TOP3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOP3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOP3A BINDING SITE, designated SEQ ID:1132, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9313] Another function of VGAM313 is therefore inhibition of Topoisomerase (DNA) III Alpha (TOP3A, Accession NM_004618). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOP3A. UC28 (Accession NM_021635) is another VGAM313 host target gene. UC28

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UC28, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UC28 BINDING SITE, designated SEQ ID:1951, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9314] Another function of VGAM313 is therefore inhibition of UC28 (Accession NM_021635). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UC28. ADP-ribosylation Factor-like 5 (ARL5, Accession NM_012097) is another VGAM313 host target gene. ARL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARL5 BINDING SITE, designated SEQ ID:1406, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9315] Another function of VGAM313 is therefore inhibition of

ADP-ribosylation Factor-like 5 (ARL5, Accession NM_012097). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARL5. DDM36 (Accession NM_020962) is another VGAM313 host target gene. DDM36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DDM36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DDM36 BINDING SITE, designated SEQ ID:1932, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9316] Another function of VGAM313 is therefore inhibition of DDM36 (Accession NM_020962). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DDM36. FLJ21596 (Accession NM_024823) is another VGAM313 host target gene. FLJ21596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:2093, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9317] Another function of VGAM313 is therefore inhibition of FLJ21596 (Accession NM_024823). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596. FLJ22202 (Accession NM_024883) is another VGAM313 host target gene. FLJ22202 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22202, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22202 BINDING SITE, designated SEQ ID:2102, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9318] Another function of VGAM313 is therefore inhibition of FLJ22202 (Accession NM_024883). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22202.

Glycoprotein (transmembrane) Nmb (GPNMB, Accession NM_002510) is another VGAM313 host target gene. GPNMB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GPNMB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPNMB BINDING SITE, designated SEQ ID:935, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9319] Another function of VGAM313 is therefore inhibition of Glycoprotein (transmembrane) Nmb (GPNMB, Accession NM_002510). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPNMB. HSZFP36 (Accession XM_032822) is another VGAM313 host target gene. HSZFP36 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSZFP36, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSZFP36 BINDING SITE, designated SEQ ID:2659, to the nucleotide sequence of VGAM313 RNA,

herein designated VGAM RNA, also designated SEQ ID:648.

[9320] Another function of VGAM313 is therefore inhibition of HSZFP36 (Accession XM_032822). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSZFP36. IPLA2(GAMMA) (Accession XM_027224) is another VGAM313 host target gene. IPLA2(GAMMA) BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IPLA2(GAMMA), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IPLA2(GAMMA) BINDING SITE, designated SEQ ID:2577, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9321] Another function of VGAM313 is therefore inhibition of IPLA2(GAMMA) (Accession XM_027224). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IPLA2(GAMMA). KIAA0648 (Accession XM_094043) is another VGAM313 host target gene. KIAA0648 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0648, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0648 BINDING SITE, designated SEQ ID:3258, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9322] Another function of VGAM313 is therefore inhibition of KIAA0648 (Accession XM_094043). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0648. KIAA1239 (Accession XM_049078) is another VGAM313 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:2915, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9323] Another function of VGAM313 is therefore inhibition of KIAA1239 (Accession XM_049078). Accordingly, utilities

of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1239. KIAA1577 (Accession XM_035299) is another VGAM313 host target gene. KIAA1577 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1577, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1577 BINDING SITE, designated SEQ ID:2691, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9324] Another function of VGAM313 is therefore inhibition of KIAA1577 (Accession XM_035299). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1577. KIAA1821 (Accession XM_050101) is another VGAM313 host target gene. KIAA1821 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1821 BINDING SITE, designated SEQ ID:2926, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9325] Another function of VGAM313 is therefore inhibition of KIAA1821 (Accession XM_050101). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1821. KIAA1853 (Accession XM_045184) is another VGAM313 host target gene. KIAA1853 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1853 BINDING SITE, designated SEQ ID:2857, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9326] Another function of VGAM313 is therefore inhibition of KIAA1853 (Accession XM_045184). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1853. MGC3169 (Accession NM_024074) is another VGAM313 host target gene. MGC3169 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MGC3169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC3169 BINDING SITE, designated SEQ ID:2051, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9327] Another function of VGAM313 is therefore inhibition of MGC3169 (Accession NM_024074). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC3169. MST4 (Accession NM_016542) is another VGAM313 host target gene. MST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MST4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MST4 BINDING SITE, designated SEQ ID:1696, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9328] Another function of VGAM313 is therefore inhibition of

MST4 (Accession NM_016542). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MST4. Phosphodiesterase 10A (PDE10A, Accession NM_006661) is another VGAM313 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:1321, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9329] Another function of VGAM313 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. SKD3 (Accession NM_030813) is another VGAM313 host target gene. SKD3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SKD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SKD3 BINDING SITE, designated SEQ ID:2170, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9330] Another function of VGAM313 is therefore inhibition of SKD3 (Accession NM_030813). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKD3. Syntaxin 18 (STX18, Accession NM_016930) is another VGAM313 host target gene. STX18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STX18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STX18 BINDING SITE, designated SEQ ID:1714, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9331] Another function of VGAM313 is therefore inhibition of Syntaxin 18 (STX18, Accession NM_016930). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STX18. LOC115811 (Accession NM_138451) is an-

other VGAM313 host target gene. LOC115811 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC115811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115811 BINDING SITE, designated SEQ ID:2441, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9332] Another function of VGAM313 is therefore inhibition of LOC115811 (Accession NM_138451). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115811. LOC131308 (Accession XM_059501) is another VGAM313 host target gene. LOC131308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC131308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC131308 BINDING SITE, designated SEQ ID:3013, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9333] Another function of VGAM313 is therefore inhibition of LOC131308 (Accession XM_059501). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC131308. LOC139221 (Accession XM_066558) is another VGAM313 host target gene. LOC139221 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC139221, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC139221 BINDING SITE, designated SEQ ID:3036, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9334] Another function of VGAM313 is therefore inhibition of LOC139221 (Accession XM_066558). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC139221. LOC158490 (Accession XM_088585) is another VGAM313 host target gene. LOC158490 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158490, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158490 BINDING SITE, designated SEQ ID:3220, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9335] Another function of VGAM313 is therefore inhibition of LOC158490 (Accession XM_088585). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158490. LOC221466 (Accession XM_168087) is another VGAM313 host target gene. LOC221466 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221466, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221466 BINDING SITE, designated SEQ ID:3618, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9336] Another function of VGAM313 is therefore inhibition of LOC221466 (Accession XM_168087). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221466. LOC221540 (Accession XM_168133) is another VGAM313 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221540 BINDING SITE, designated SEQ ID:3621, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9337] Another function of VGAM313 is therefore inhibition of LOC221540 (Accession XM_168133). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC222233 (Accession XM_168560) is another VGAM313 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222233 BINDING SITE, designated SEQ ID:3648, to the nucleotide sequence of VGAM313 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:648.

[9338] Another function of VGAM313 is therefore inhibition of LOC222233 (Accession XM_168560). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC255042 (Accession XM_170896) is another VGAM313 host target gene. LOC255042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC255042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255042 BINDING SITE, designated SEQ ID:3671, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9339] Another function of VGAM313 is therefore inhibition of LOC255042 (Accession XM_170896). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255042. LOC256117 (Accession XM_172828) is another VGAM313 host target gene. LOC256117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC256117, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256117 BINDING SITE, designated SEQ ID:3705, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9340] Another function of VGAM313 is therefore inhibition of LOC256117 (Accession XM_172828). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256117. LOC257545 (Accession XM_175217) is another VGAM313 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:3747, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9341] Another function of VGAM313 is therefore inhibition of LOC257545 (Accession XM_175217). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM_175295) is another VGAM313 host target gene. LOC257598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:3750, to the nucleotide sequence of VGAM313 RNA, herein designated VGAM RNA, also designated SEQ ID:648.

[9342] Another function of VGAM313 is therefore inhibition of LOC257598 (Accession XM_175295). Accordingly, utilities of VGAM313 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257598. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 314 (VGAM314) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9343] VGAM314 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM314 was detected is described hereinabove with reference to Figs. 1–8.

[9344] VGAM314 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9345] VGAM314 gene encodes a VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM314 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM314 precursor RNA is designated SEQ ID:300, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:300 is located at position 10620 relative to the genome of Vaccinia Virus.

[9346] VGAM314 precursor RNA folds onto itself, forming VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9347] An enzyme complex designated DICER COMPLEX, `dices` the VGAM314 folded precursor RNA into VGAM314 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 86%) nucleotide sequence of VGAM314 RNA is designated SEQ ID:649, and is provided hereinbelow with reference to the sequence listing part.

[9348] VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM314 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9349] VGAM314 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM314 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM314 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9350] The complementary binding of VGAM314 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM314 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM314 host target RNA into VGAM314 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9351] It is appreciated that VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM314 host target genes. The mRNA of each one of this plurality of VGAM314 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM314 RNA, herein designated VGAM RNA, and which when bound by VGAM314 RNA causes inhibition of translation of respective one or more VGAM314 host target proteins.

[9352] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM314 gene, herein designated VGAM GENE, on one or more VGAM314 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9353] It is yet further appreciated that a function of VGAM314 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM314 correlate with, and may be deduced from, the identity of the host target genes which VGAM314 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9354] Nucleotide sequences of the VGAM314 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM314 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM314 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM314 are further described hereinbelow with reference to Table 1.

[9355] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM314 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM314 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9356] As mentioned hereinabove with reference to Fig. 1, a function of VGAM314 gene, herein designated VGAM is inhibition of expression of VGAM314 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM314 correlate with, and may be deduced from, the identity of the target genes which VGAM314 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9357] Chorea Acanthocytosis (CHAC, Accession NM_015186) is a VGAM314 host target gene. CHAC BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by CHAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHAC BINDING SITE, designated SEQ ID:1612, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9358] A function of VGAM314 is therefore inhibition of Chorea Acanthocytosis (CHAC, Accession NM_015186), a gene which may regulate the cycling of proteins. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHAC. The function of CHAC and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM68. Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821) is another VGAM314 host target gene. GGCX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GGCX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGCX BINDING SITE, designated SEQ ID:778,

to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9359] Another function of VGAM314 is therefore inhibition of Gamma-glutamyl Carboxylase (GGCX, Accession NM_000821). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGCX. Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221) is another VGAM314 host target gene. ITPKB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPKB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPKB BINDING SITE, designated SEQ ID:911, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9360] Another function of VGAM314 is therefore inhibition of Inositol 1,4,5-trisphosphate 3-kinase B (ITPKB, Accession NM_002221), a gene which is a type B inositol 1,4,5-triphosphate 3 kinase. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPKB. The

function of ITPKB and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM68. Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM_027634) is another VGAM314 host target gene. KCNAB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNAB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNAB1 BINDING SITE, designated SEQ ID:2584, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9361] Another function of VGAM314 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Beta Member 1 (KCNAB1, Accession XM_027634), a gene which is the regulatory beta subunit for a shaker-related voltage-gated potassium channel. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNAB1. The function of KCNAB1 and its association

with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM68. Killer Cell Lectin-like Receptor Subfamily C, Member 4 (KLRC4, Accession NM_013431) is another VGAM314 host target gene. KLRC4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KLRC4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLRC4 BINDING SITE, designated SEQ ID:1451, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9362] Another function of VGAM314 is therefore inhibition of Killer Cell Lectin-like Receptor Subfamily C, Member 4 (KLRC4, Accession NM_013431), a gene which is a receptor for the recognition of mhc class i hla-e molecules by nk cells and some cytotoxic t-cells. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLRC4. The function of KLRC4 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference

to VGAM68. Myeloid Leukemia Factor 2 (MLF2, Accession NM_005439) is another VGAM314 host target gene. MLF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLF2 BINDING SITE, designated SEQ ID:1212, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9363] Another function of VGAM314 is therefore inhibition of Myeloid Leukemia Factor 2 (MLF2, Accession NM_005439). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLF2. Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_022002) is another VGAM314 host target gene. NR1I2 BINDING SITE1 and NR1I2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NR1I2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NR1I2 BINDING SITE1 and NR1I2 BINDING

SITE2, designated SEQ ID:1971 and SEQ ID:1067 respectively, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9364] Another function of VGAM314 is therefore inhibition of Nuclear Receptor Subfamily 1, Group I, Member 2 (NR1I2, Accession NM_022002), a gene which binds to a response element in the cyp3a4 gene promoter and activates its expression in response to a wide variety of endobiotics and xenobiotics. Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NR1I2. The function of NR1I2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM68.FHX (Accession NM_018416) is another VGAM314 host target gene. FHX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHX BINDING SITE, designated SEQ ID:1825, to the nucleotide sequence of VGAM314 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:649.

[9365] Another function of VGAM314 is therefore inhibition of FHX (Accession NM_018416). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHX. FLJ10352 (Accession NM_032142) is another VGAM314 host target gene. FLJ10352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10352 BINDING SITE, designated SEQ ID:2233, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9366] Another function of VGAM314 is therefore inhibition of FLJ10352 (Accession NM_032142). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10352. FLJ22127 (Accession NM_022775) is another VGAM314 host target gene. FLJ22127 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22127, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22127 BINDING SITE, designated SEQ ID:2008, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9367] Another function of VGAM314 is therefore inhibition of FLJ22127 (Accession NM_022775). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22127. Ganglioside-induced Differentiation-associated Protein 1-like 1 (GDAP1L1, Accession NM_024034) is another VGAM314 host target gene. GDAP1L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GDAP1L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GDAP1L1 BINDING SITE, designated SEQ ID:2043, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9368] Another function of VGAM314 is therefore inhibition of Ganglioside-induced Differentiation-associated Protein

1-like 1 (GDAP1L1, Accession NM_024034). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GDAP1L1. H-L(3)MBT (Accession NM_032107) is another VGAM314 host target gene. H-L(3)MBT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by H-L(3)MBT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-L(3)MBT BINDING SITE, designated SEQ ID:2230, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9369] Another function of VGAM314 is therefore inhibition of H-L(3)MBT (Accession NM_032107). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-L(3)MBT. KIAA1340 (Accession XM_044836) is another VGAM314 host target gene. KIAA1340 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1340, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1340 BINDING SITE, designated SEQ ID:2846, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9370] Another function of VGAM314 is therefore inhibition of KIAA1340 (Accession XM_044836). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1340. Kinesin-like 7 (KNSL7, Accession NM_020242) is another VGAM314 host target gene. KNSL7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KNSL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KNSL7 BINDING SITE, designated SEQ ID:1905, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9371] Another function of VGAM314 is therefore inhibition of Kinesin-like 7 (KNSL7, Accession NM_020242). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KNSL7. P5-1 (Accession NM_006674) is another

VGAM314 host target gene. P5-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P5-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P5-1 BINDING SITE, designated SEQ ID:1322, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9372] Another function of VGAM314 is therefore inhibition of P5-1 (Accession NM_006674). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P5-1. PP1044 (Accession NM_021730) is another VGAM314 host target gene. PP1044 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PP1044, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PP1044 BINDING SITE, designated SEQ ID:1956, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9373] Another function of VGAM314 is therefore inhibition of PP1044 (Accession NM_021730). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PP1044. Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065) is another VGAM314 host target gene. SIRPB1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SIRPB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SIRPB1 BINDING SITE, designated SEQ ID:1272, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9374] Another function of VGAM314 is therefore inhibition of Signal-regulatory Protein Beta 1 (SIRPB1, Accession NM_006065). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SIRPB1. LOC148811 (Accession XM_086326) is another VGAM314 host target gene. LOC148811 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded

by LOC148811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148811 BINDING SITE, designated SEQ ID:3126, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9375] Another function of VGAM314 is therefore inhibition of LOC148811 (Accession XM_086326). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148811. LOC149711 (Accession XM_097720) is another VGAM314 host target gene. LOC149711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149711 BINDING SITE, designated SEQ ID:3315, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9376] Another function of VGAM314 is therefore inhibition of LOC149711 (Accession XM_097720). Accordingly, utilities

of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149711. LOC150630 (Accession XM_097931) is another VGAM314 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:3332, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9377] Another function of VGAM314 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC150819 (Accession XM_097954) is another VGAM314 host target gene. LOC150819 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150819, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC150819 BINDING SITE, designated SEQ ID:3333, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9378] Another function of VGAM314 is therefore inhibition of LOC150819 (Accession XM_097954). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150819. LOC154877 (Accession XM_098626) is another VGAM314 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:3373, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9379] Another function of VGAM314 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154877. LOC158327 (Accession XM_088548) is another VGAM314 host target gene. LOC158327 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158327, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158327 BINDING SITE, designated SEQ ID:3216, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9380] Another function of VGAM314 is therefore inhibition of LOC158327 (Accession XM_088548). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158327. LOC196540 (Accession XM_116933) is another VGAM314 host target gene. LOC196540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC196540, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196540 BINDING SITE, designated SEQ ID:3467, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9381] Another function of VGAM314 is therefore inhibition of

LOC196540 (Accession XM_116933). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196540. LOC220394 (Accession XM_166936) is another VGAM314 host target gene. LOC220394 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220394, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220394 BINDING SITE, designated SEQ ID:3581, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9382] Another function of VGAM314 is therefore inhibition of LOC220394 (Accession XM_166936). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220394. LOC254428 (Accession XM_170932) is another VGAM314 host target gene. LOC254428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254428 BINDING SITE, designated SEQ ID:3677, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9383] Another function of VGAM314 is therefore inhibition of LOC254428 (Accession XM_170932). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254428. LOC92405 (Accession XM_044914) is another VGAM314 host target gene. LOC92405 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92405, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92405 BINDING SITE, designated SEQ ID:2848, to the nucleotide sequence of VGAM314 RNA, herein designated VGAM RNA, also designated SEQ ID:649.

[9384] Another function of VGAM314 is therefore inhibition of LOC92405 (Accession XM_044914). Accordingly, utilities of VGAM314 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92405. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 315 (VGAM315) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9385] VGAM315 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM315 was detected is described hereinabove with reference to Figs. 1–8.

[9386] VGAM315 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9387] VGAM315 gene encodes a VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM315 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM315 precursor RNA is designated SEQ ID:301, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:301 is

located at position 179807 relative to the genome of Vac-
cinia Virus.

[9388] VGAM315 precursor RNA folds onto itself, forming VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9389] An enzyme complex designated DICER COMPLEX, `dices` the VGAM315 folded precursor RNA into VGAM315 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 85%) nucleotide sequence of VGAM315 RNA is designated SEQ ID:650, and is provided hereinbelow with reference to the sequence listing part.

[9390] VGAM315 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM315 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9391] VGAM315 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM315 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM315 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM315 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9392] The complementary binding of VGAM315 RNA, herein designated VGAM RNA, to host target binding sites on VGAM315 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM315 host target RNA into VGAM315 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9393] It is appreciated that VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM315 host target genes. The mRNA of each one of this plurality of VGAM315 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM315 RNA, herein designated VGAM RNA, and which when bound by VGAM315 RNA causes inhibition of translation of respective one or more VGAM315

host target proteins.

[9394] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM315 gene, herein designated VGAM GENE, on one or more VGAM315 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9395] It is yet further appreciated that a function of VGAM315 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM315 correlate with, and may be deduced from, the identity of the host target genes which VGAM315 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9396] Nucleotide sequences of the VGAM315 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM315 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM315 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM315 are further described hereinbelow with reference to Table 1.
- [9397] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM315 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM315 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9398] As mentioned hereinabove with reference to Fig. 1, a function of VGAM315 gene, herein designated VGAM is inhibition of expression of VGAM315 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM315 correlate with, and may be deduced from, the identity of the target genes which VGAM315 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9399] Phosphatidylinositol Glycan, Class H (PIGH, Accession NM_004569) is a VGAM315 host target gene. PIGH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGH BINDING SITE, designated SEQ ID:1126, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:650.

[9400] A function of VGAM315 is therefore inhibition of Phosphatidylinositol Glycan, Class H (PIGH, Accession NM_004569), a gene which catalyzes transfer of GlcNAc to PI. Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGH. The function of PIGH has been established by previous studies. The PIGH gene encodes an enzyme involved in the biosynthesis of glycosylphosphatidylinositol anchor; see PIGA (OMIM Ref. No. 311770)

and PIGF (OMIM Ref. No. 600153) for other components of the system. Kamitani et al. (1993) isolated cDNA for a human gene that repaired the defect in a complementation class H mutant cell line. They determined that PIGH encodes a predicted protein of 188 amino acids. Ware et al. (1994) demonstrated that the mouse *Pigh* gene is located on chromosome 12 in a region of homology of synteny with 14q11–q24. Watanabe et al. (1996) demonstrated that the PIGA and PIGH proteins form a protein complex and are subunits of the GPI GlcNAc transferase of the endoplasmic reticulum (ER). They showed that PIGH is a cytoplasmic ER-associated protein. Using immunoprecipitation experiments, Watanabe et al. (1998) demonstrated that PIGQ (OMIM Ref. No. 605754) associates specifically with PIGA, PIGC (OMIM Ref. No. 601730), and PIGH and that all 4 proteins form a complex that has GPI–GlcNAc transferase (GPI–GnT) activity in vitro

[9401] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9402] Watanabe, R.; Inoue, N.; Westfall, B.; Taron, C. H.; Orlean, P.; Takeda, J.; Kinoshita, T. : The first step of glycosylphosphatidylinositol biosynthesis is mediated by a

complex of PIG-A, PIG-H, PIG-C and GPI1. EMBO J. 17: 877-885, 1998. ; and

- [9403] Watanabe, R.; Kinoshita, T.; Masaki, R.; Yamamoto, A.; Takeda, J.; Inoue, N. : PIG-A and PIG-H, which participate in glycosylphosphatidylinositol anchor biosynthesis, form a protein comp.
- [9404] Further studies establishing the function and utilities of PIGH are found in John Hopkins OMIM database record ID 600154, and in cited publications numbered 32 and 1853-1855 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PRSC (Accession NM_006587) is another VGAM315 host target gene. PRSC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRSC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRSC BINDING SITE, designated SEQ ID:1313, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:650.
- [9405] Another function of VGAM315 is therefore inhibition of PRSC (Accession NM_006587). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with PRSC. Peroxisomal Membrane Protein 4, 24kDa (PXMP4, Accession NM_007238) is another VGAM315 host target gene.

PXMP4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PXMP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PXMP4 BINDING SITE, designated SEQ ID:1370, to the nucleotide sequence of VGAM315 RNA, herein designated VGAM RNA, also designated SEQ ID:650.

[9406] Another function of VGAM315 is therefore inhibition of Peroxisomal Membrane Protein 4, 24kDa (PXMP4, Accession NM_007238). Accordingly, utilities of VGAM315 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PXMP4. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 316 (VGAM316) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9407] VGAM316 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM316 was detected is described hereinabove with reference to Figs. 1–8.

[9408] VGAM316 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9409] VGAM316 gene encodes a VGAM316 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM316 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM316 precursor RNA is designated SEQ ID:302, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:302 is located at position 6123 relative to the genome of Vaccinia Virus.

[9410] VGAM316 precursor RNA folds onto itself, forming VGAM316 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9411] An enzyme complex designated DICER COMPLEX, `dices` the VGAM316 folded precursor RNA into VGAM316 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM316 RNA is designated SEQ ID:651, and is provided hereinbelow with reference to the sequence listing part.

[9412] VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM316 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[9413] VGAM316 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM316 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM316 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9414] The complementary binding of VGAM316 RNA, herein designated VGAM RNA, to host target binding sites on VGAM316 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM316 host target RNA into VGAM316 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9415] It is appreciated that VGAM316 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM316 host target genes. The mRNA of each one of this plurality of VGAM316 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM316 RNA, herein designated VGAM RNA, and which when bound by VGAM316 RNA causes inhibition of translation of respective one or more VGAM316 host target proteins.

[9416] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM316 gene, herein designated VGAM GENE, on one or more VGAM316 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9417] It is yet further appreciated that a function of VGAM316 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM316 correlate with, and may be deduced from, the identity of the host target genes which VGAM316 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9418] Nucleotide sequences of the VGAM316 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM316 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM316 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM316 are further
described hereinbelow with reference to Table 1.

[9419] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM316 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM316 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[9420] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM316 gene, herein designated VGAM is
inhibition of expression of VGAM316 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM316 correlate with, and may be deduced
from, the identity of the target genes which VGAM316
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[9421] Chromosome 1 Open Reading Frame 1 (C1orf1, Accession
NM_001213) is a VGAM316 host target gene. C1orf1

BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C1orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf1 BINDING SITE, designated SEQ ID:809, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:651.

[9422] A function of VGAM316 is therefore inhibition of Chromosome 1 Open Reading Frame 1 (C1orf1, Accession NM_001213). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf1. Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181) is another VGAM316 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:2556, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:651.

[9423] Another function of VGAM316 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274) is another VGAM316 host target gene. MYBL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYBL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYBL1 BINDING SITE, designated SEQ ID:2679, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:651.

[9424] Another function of VGAM316 is therefore inhibition of V-myb Myeloblastosis Viral Oncogene Homolog (avian)-like 1 (MYBL1, Accession XM_034274), a gene which could have a role in the proliferation and/or differentiation of neurogenic, spermatogenic and b-lymphoid cells. Accord-

ingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYBL1. The function of MYBL1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM51. KIAA1028 (Accession XM_166324) is another VGAM316 host target gene.

KIAA1028 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1028, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1028 BINDING SITE, designated SEQ ID:3547, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:651.

[9425] Another function of VGAM316 is therefore inhibition of KIAA1028 (Accession XM_166324). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1028. MGC2488 (Accession NM_024039) is another VGAM316 host target gene. MGC2488 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by MGC2488, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2488 BINDING SITE, designated SEQ ID:2045, to the nucleotide sequence of VGAM316 RNA, herein designated VGAM RNA, also designated SEQ ID:651.

[9426] Another function of VGAM316 is therefore inhibition of MGC2488 (Accession NM_024039). Accordingly, utilities of VGAM316 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2488. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 317 (VGAM317) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9427] VGAM317 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM317 was detected is described hereinabove with reference to Figs. 1–8.

[9428] VGAM317 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Vaccinia Virus.

VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9429] VGAM317 gene encodes a VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM317 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM317 precursor RNA is designated SEQ ID:303, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:303 is located at position 6573 relative to the genome of Vaccinia Virus.

[9430] VGAM317 precursor RNA folds onto itself, forming VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9431] An enzyme complex designated DICER COMPLEX, `dices` the VGAM317 folded precursor RNA into VGAM317 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM317 RNA is designated SEQ ID:652, and is provided hereinbelow with reference to the sequence listing part.

[9432] VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM317 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9433] VGAM317 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM317 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM317 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9434] The complementary binding of VGAM317 RNA, herein designated VGAM RNA, to host target binding sites on VGAM317 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM317 host tar-

get RNA into VGAM317 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9435] It is appreciated that VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM317 host target genes. The mRNA of each one of this plurality of VGAM317 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM317 RNA, herein designated VGAM RNA, and which when bound by VGAM317 RNA causes inhibition of translation of respective one or more VGAM317 host target proteins.

[9436] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM317 gene, herein designated VGAM GENE, on one or more VGAM317 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9437] It is yet further appreciated that a function of VGAM317 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM317 correlate with, and may be deduced from, the identity of the host target genes which VGAM317 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9438] Nucleotide sequences of the VGAM317 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM317 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM317 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM317 are further

described hereinbelow with reference to Table 1.

[9439] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM317 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM317 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9440] As mentioned hereinabove with reference to Fig. 1, a function of VGAM317 gene, herein designated VGAM is inhibition of expression of VGAM317 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM317 correlate with, and may be deduced from, the identity of the target genes which VGAM317 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9441] Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502) is a VGAM317 host target gene. CX3CR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CX3CR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of CX3CR1 BINDING SITE, designated SEQ ID:2891, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:652.

[9442] A function of VGAM317 is therefore inhibition of Chemokine (C-X3-C motif) Receptor 1 (CX3CR1, Accession XM_047502), a gene which mediates both the adhesive and migratory functions of fractalkine. Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CX3CR1. The function of CX3CR1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM52. Wingless-type MMTV Integration Site Family, Member 14 (WNT14, Accession NM_003395) is another VGAM317 host target gene. WNT14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WNT14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT14 BINDING SITE, designated SEQ ID:1014, to the nucleotide sequence of VGAM317 RNA,

herein designated VGAM RNA, also designated SEQ ID:652.

[9443] Another function of VGAM317 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 14 (WNT14, Accession NM_003395), a gene which is a ligand for members of the frizzled family of seven transmembrane receptors and may be a signaling molecule which affect the development of discrete regions of tissues. Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WNT14. The function of WNT14 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM52.FLJ20275 (Accession NM_017737) is another VGAM317 host target gene. FLJ20275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20275 BINDING SITE, designated SEQ ID:1745, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ

ID:652.

[9444] Another function of VGAM317 is therefore inhibition of FLJ20275 (Accession NM_017737). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20275. FLJ22390 (Accession NM_022746) is another VGAM317 host target gene. FLJ22390 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:2002, to the nucleotide sequence of VGAM317 RNA, herein designated VGAM RNA, also designated SEQ ID:652.

[9445] Another function of VGAM317 is therefore inhibition of FLJ22390 (Accession NM_022746). Accordingly, utilities of VGAM317 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 318 (VGAM318) viral gene, which modulates expression of

respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9446] VGAM318 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM318 was detected is described hereinabove with reference to Figs. 1–8.

[9447] VGAM318 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9448] VGAM318 gene encodes a VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM318 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM318 precursor RNA is designated SEQ ID:304, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:304 is located at position 5257 relative to the genome of Vaccinia Virus.

[9449] VGAM318 precursor RNA folds onto itself, forming VGAM318 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9450] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM318 folded precursor RNA into VGAM318 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 83%) nucleotide se-
quence of VGAM318 RNA is designated SEQ ID:653, and is
provided hereinbelow with reference to the sequence list-
ing part.

[9451] VGAM318 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM318 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM318 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9452] VGAM318 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM318 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM318 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9453] The complementary binding of VGAM318 RNA, herein designated VGAM RNA, to host target binding sites on VGAM318 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM318 host target RNA into VGAM318 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9454] It is appreciated that VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM318 host target genes. The mRNA of each one of this plurality of VGAM318 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM318 RNA, herein designated VGAM RNA, and which when bound by VGAM318 RNA causes inhibition of translation of respective one or more VGAM318 host target proteins.

[9455] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM318 gene, herein designated VGAM GENE, on one or more VGAM318 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9456] It is yet further appreciated that a function of VGAM318 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM318 correlate with, and may be deduced from, the identity of the host target genes which VGAM318 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [9457] Nucleotide sequences of the VGAM318 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM318 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM318 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM318 are further described hereinbelow with reference to Table 1.
- [9458] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM318 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM318 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9459] As mentioned hereinabove with reference to Fig. 1, a function of VGAM318 gene, herein designated VGAM is inhibition of expression of VGAM318 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM318 correlate with, and may be deduced from, the identity of the target genes which VGAM318 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9460] LOC120864 (Accession XM_058510) is a VGAM318 host target gene. LOC120864 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC120864, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120864 BINDING SITE, designated SEQ ID:2986, to the nucleotide sequence of VGAM318 RNA, herein designated VGAM RNA, also designated SEQ ID:653.

[9461] A function of VGAM318 is therefore inhibition of LOC120864 (Accession XM_058510). Accordingly, utilities of VGAM318 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120864. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 319 (VGAM319) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9462] VGAM319 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM319 was detected is described hereinabove with reference to Figs. 1–8.

[9463] VGAM319 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9464] VGAM319 gene encodes a VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM319 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM319 precursor RNA is designated SEQ ID:305, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:305 is located at position 4867 relative to the genome of Vaccinia Virus.

[9465] VGAM319 precursor RNA folds onto itself, forming VGAM319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9466] An enzyme complex designated DICER COMPLEX, `dices` the VGAM319 folded precursor RNA into VGAM319 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM319 RNA is designated SEQ ID:654, and is provided hereinbelow with reference to the sequence listing part.

[9467] VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM319 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9468] VGAM319 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM319 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM319 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9469] The complementary binding of VGAM319 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM319 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM319 host target RNA into VGAM319 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9470] It is appreciated that VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM319 host target genes. The mRNA of each one of this plurality of VGAM319 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM319 RNA, herein designated VGAM RNA, and which when bound by VGAM319 RNA causes inhibition of translation of respective one or more VGAM319 host target proteins.

[9471] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM319 gene, herein designated VGAM GENE, on one or more VGAM319 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9472] It is yet further appreciated that a function of VGAM319 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM319 correlate with, and may be deduced from, the identity of the host target genes which VGAM319 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9473] Nucleotide sequences of the VGAM319 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM319 RNA, herein designated VGAM RNA,

and a schematic representation of the secondary folding of VGAM319 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM319 are further described hereinbelow with reference to Table 1.

[9474] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM319 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM319 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9475] As mentioned hereinabove with reference to Fig. 1, a function of VGAM319 gene, herein designated VGAM is inhibition of expression of VGAM319 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM319 correlate with, and may be deduced from, the identity of the target genes which VGAM319 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9476] KIAA0626 (Accession NM_021647) is a VGAM319 host target gene. KIAA0626 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0626, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0626 BINDING SITE, designated SEQ ID:1954, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:654.

[9477] A function of VGAM319 is therefore inhibition of KIAA0626 (Accession NM_021647). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0626. KIAA1239 (Accession XM_049078) is another VGAM319 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:2914, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:654.

[9478] Another function of VGAM319 is therefore inhibition of KIAA1239 (Accession XM_049078). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1239. LOC201475 (Accession XM_113967) is another VGAM319 host target gene. LOC201475 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201475 BINDING SITE, designated SEQ ID:3428, to the nucleotide sequence of VGAM319 RNA, herein designated VGAM RNA, also designated SEQ ID:654.

[9479] Another function of VGAM319 is therefore inhibition of LOC201475 (Accession XM_113967). Accordingly, utilities of VGAM319 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201475. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 320 (VGAM320) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9480] VGAM320 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM320 was detected is described hereinabove with reference to Figs. 1–8.

[9481] VGAM320 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9482] VGAM320 gene encodes a VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM320 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM320 precursor RNA is designated SEQ ID:306, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:306 is located at position 190678 relative to the genome of Vaccinia Virus.

[9483] VGAM320 precursor RNA folds onto itself, forming VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9484] An enzyme complex designated DICER COMPLEX, `dices` the VGAM320 folded precursor RNA into VGAM320 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 83%) nucleotide sequence of VGAM320 RNA is designated SEQ ID:655, and is provided hereinbelow with reference to the sequence listing part.

[9485] VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM320 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9486] VGAM320 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM320 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM320 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9487] The complementary binding of VGAM320 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM320 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM320 host target RNA into VGAM320 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9488] It is appreciated that VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM320 host target genes. The mRNA of each one of this plurality of VGAM320 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM320 RNA, herein designated VGAM RNA, and which when bound by VGAM320 RNA causes inhibition of translation of respective one or more VGAM320 host target proteins.

[9489] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM320 gene, herein designated VGAM GENE, on one or more VGAM320 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9490] It is yet further appreciated that a function of VGAM320 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM320 correlate with, and may be deduced from, the identity of the host target genes which VGAM320 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9491] Nucleotide sequences of the VGAM320 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM320 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM320 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM320 are further described hereinbelow with reference to Table 1.

[9492] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM320 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM320 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9493] As mentioned hereinabove with reference to Fig. 1, a function of VGAM320 gene, herein designated VGAM is inhibition of expression of VGAM320 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM320 correlate with, and may be deduced from, the identity of the target genes which VGAM320 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9494] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM320 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the

3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9495] A function of VGAM320 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM320 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9496] Another function of VGAM320 is therefore inhibition of

Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM320 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9497] Another function of VGAM320 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to

leukocytes. Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM320 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9498] Another function of VGAM320 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM320 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9499] Another function of VGAM320 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM320 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9500] Another function of VGAM320 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities

of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM320 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM320 RNA, herein designated VGAM RNA, also designated SEQ ID:655.

[9501] Another function of VGAM320 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM320 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 321 (VGAM321) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9502] VGAM321 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM321 was detected is described hereinabove with reference to Figs. 1–8.

[9503] VGAM321 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9504] VGAM321 gene encodes a VGAM321 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM321 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM321 precursor RNA is designated SEQ ID:307, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:307 is located at position 188927 relative to the genome of Vaccinia Virus.

[9505] VGAM321 precursor RNA folds onto itself, forming VGAM321 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9506] An enzyme complex designated DICER COMPLEX, `dices` the VGAM321 folded precursor RNA into VGAM321 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM321 RNA is designated SEQ ID:656, and is provided hereinbelow with reference to the sequence listing part.

[9507] VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM321 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[9508] VGAM321 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM321 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM321 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9509] The complementary binding of VGAM321 RNA, herein designated VGAM RNA, to host target binding sites on VGAM321 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM321 host target RNA into VGAM321 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9510] It is appreciated that VGAM321 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM321 host target genes. The mRNA of each one of this plurality of VGAM321 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM321 RNA, herein designated VGAM RNA, and which when bound by VGAM321 RNA causes inhibition of translation of respective one or more VGAM321 host target proteins.

[9511] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM321 gene, herein designated VGAM GENE, on one or more VGAM321 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9512] It is yet further appreciated that a function of VGAM321 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM321 correlate with, and may be deduced from, the identity of the host target genes which VGAM321 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9513] Nucleotide sequences of the VGAM321 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM321 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM321 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM321 are further
described hereinbelow with reference to Table 1.

[9514] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM321 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM321 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[9515] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM321 gene, herein designated VGAM is
inhibition of expression of VGAM321 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM321 correlate with, and may be deduced
from, the identity of the target genes which VGAM321
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[9516] Calpain 2, (m/II) Large Subunit (CAPN2, Accession
NM_001748) is a VGAM321 host target gene. CAPN2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9517] A function of VGAM321 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM321 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9518] Another function of VGAM321 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM321 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9519] Another function of VGAM321 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine

induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM321 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9520] Another function of VGAM321 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM321 host target gene. LOC222671 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9521] Another function of VGAM321 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM321 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9522] Another function of VGAM321 is therefore inhibition of

LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM321 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM321 RNA, herein designated VGAM RNA, also designated SEQ ID:656.

[9523] Another function of VGAM321 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM321 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 322 (VGAM322) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[9524] VGAM322 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM322 was detected is described hereinabove with reference to Figs. 1–8.

[9525] VGAM322 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus. VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9526] VGAM322 gene encodes a VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM322 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM322 precursor RNA is designated SEQ ID:308, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:308 is located at position 188927 relative to the genome of Vaccinia Virus.

[9527] VGAM322 precursor RNA folds onto itself, forming VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9528] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM322 folded precursor RNA into VGAM322 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 84%) nucleotide se-
quence of VGAM322 RNA is designated SEQ ID:657, and is
provided hereinbelow with reference to the sequence list-
ing part.

[9529] VGAM322 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM322 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM322 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9530] VGAM322 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM322 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM322 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[9531] The complementary binding of VGAM322 RNA, herein designated VGAM RNA, to host target binding sites on VGAM322 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM322 host target RNA into VGAM322 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9532] It is appreciated that VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM322 host target genes. The mRNA of each one of this plurality of VGAM322 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM322 RNA, herein designated VGAM RNA, and which when bound by VGAM322 RNA causes inhibition of translation of respective one or more VGAM322 host target proteins.

[9533] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM322 gene, herein designated VGAM GENE, on one or

more VGAM322 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9534] It is yet further appreciated that a function of VGAM322 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM322 correlate with, and may be deduced from, the identity of the host target genes which VGAM322 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9535] Nucleotide sequences of the VGAM322 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM322 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM322 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM322 are further described hereinbelow with reference to Table 1.
- [9536] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM322 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM322 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9537] As mentioned hereinabove with reference to Fig. 1, a function of VGAM322 gene, herein designated VGAM is inhibition of expression of VGAM322 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM322 correlate with, and may be deduced from, the identity of the target genes which VGAM322 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [9538] Calpain 2, (m/II) Large Subunit (CAPN2, Accession

NM_001748) is a VGAM322 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9539] A function of VGAM322 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM322 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA,

also designated SEQ ID:657.

[9540] Another function of VGAM322 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM322 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9541] Another function of VGAM322 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Acces-

sion NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM322 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9542] Another function of VGAM322 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another

VGAM322 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9543] Another function of VGAM322 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM322 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9544] Another function of VGAM322 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM322 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM322 RNA, herein designated VGAM RNA, also designated SEQ ID:657.

[9545] Another function of VGAM322 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM322 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 323 (VGAM323) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[9546] VGAM323 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM323 was detected is described hereinabove with reference to Figs. 1–8.

[9547] VGAM323 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9548] VGAM323 gene encodes a VGAM323 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM323 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM323 precursor RNA is designated SEQ ID:309, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:309 is located at position 188927 relative to the genome of Vaccinia Virus.

[9549] VGAM323 precursor RNA folds onto itself, forming VGAM323 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9550] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM323 folded precursor RNA into VGAM323 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 84%) nucleotide se-
quence of VGAM323 RNA is designated SEQ ID:658, and is
provided hereinbelow with reference to the sequence list-
ing part.

[9551] VGAM323 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM323 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM323 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9552] VGAM323 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM323 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM323 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9553] The complementary binding of VGAM323 RNA, herein designated VGAM RNA, to host target binding sites on VGAM323 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM323 host target RNA into VGAM323 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9554] It is appreciated that VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM323 host target genes. The mRNA of each one of this plurality of VGAM323 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM323 RNA, herein designated VGAM RNA, and which when bound by VGAM323 RNA causes inhibition of translation of respective one or more VGAM323 host target proteins.

[9555] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM323 gene, herein designated VGAM GENE, on one or more VGAM323 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9556] It is yet further appreciated that a function of VGAM323 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM323 correlate with, and may be deduced from, the identity of the host target genes which VGAM323 binds and inhibits, and the function of these host target genes, as elaborated herein—

below.

- [9557] Nucleotide sequences of the VGAM323 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM323 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM323 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM323 are further described hereinbelow with reference to Table 1.
- [9558] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM323 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM323 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9559] As mentioned hereinabove with reference to Fig. 1, a function of VGAM323 gene, herein designated VGAM is inhibition of expression of VGAM323 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM323 correlate with, and may be deduced from, the identity of the target genes which VGAM323 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9560] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM323 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9561] A function of VGAM323 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM323 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide se-

quence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9562] Another function of VGAM323 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM323 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9563] Another function of VGAM323 is therefore inhibition of

Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM323 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9564] Another function of VGAM323 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0475. LOC222671 (Accession XM_167094) is another VGAM323 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9565] Another function of VGAM323 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM323 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM323 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:658.

[9566] Another function of VGAM323 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM323 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM323 RNA, herein designated VGAM RNA, also designated SEQ ID:658.

[9567] Another function of VGAM323 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM323 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 324 (VGAM324) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9568] VGAM324 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM324 was detected is described hereinabove with reference to Figs. 1–8.

[9569] VGAM324 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9570] VGAM324 gene encodes a VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM324 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM324 precursor RNA is designated SEQ ID:310, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:310 is located at position 188927 relative to the genome of Vaccinia Virus.

[9571] VGAM324 precursor RNA folds onto itself, forming

VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9572] An enzyme complex designated DICER COMPLEX, `dices` the VGAM324 folded precursor RNA into VGAM324 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM324 RNA is designated SEQ ID:659, and is provided hereinbelow with reference to the sequence listing part.

[9573] VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM324 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9574] VGAM324 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM324 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM324 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9575] The complementary binding of VGAM324 RNA, herein designated VGAM RNA, to host target binding sites on VGAM324 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM324 host target RNA into VGAM324 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9576] It is appreciated that VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM324 host target genes. The mRNA of each one of this plurality of VGAM324 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM324 RNA, herein designated VGAM RNA, and which when bound by VGAM324 RNA causes inhibition of translation of respective one or more VGAM324 host target proteins.

[9577] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM324 gene, herein designated VGAM GENE, on one or more VGAM324 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9578] It is yet further appreciated that a function of VGAM324 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM324 correlate with, and may be deduced from, the identity of the host target genes which VGAM324 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[9579] Nucleotide sequences of the VGAM324 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM324 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM324 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM324 are further described hereinbelow with reference to Table 1.

[9580] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM324 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM324 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9581] As mentioned hereinabove with reference to Fig. 1, a function of VGAM324 gene, herein designated VGAM is inhibition of expression of VGAM324 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM324 correlate with, and may be deduced from, the identity of the target genes which VGAM324 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[9582] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM324 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9583] A function of VGAM324 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM324 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BIND-

ING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9584] Another function of VGAM324 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM324 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9585] Another function of VGAM324 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM324 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9586] Another function of VGAM324 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM324 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9587] Another function of VGAM324 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM324 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to

the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9588] Another function of VGAM324 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM324 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM324 RNA, herein designated VGAM RNA, also designated SEQ ID:659.

[9589] Another function of VGAM324 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM324 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 325 (VGAM325) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9590] VGAM325 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM325 was detected is described hereinabove with reference to Figs. 1–8.

[9591] VGAM325 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9592] VGAM325 gene encodes a VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM325 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM325 precursor RNA is designated SEQ ID:311, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:311 is located at position 188927 relative to the genome of Vaccinia Virus.

[9593] VGAM325 precursor RNA folds onto itself, forming VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9594] An enzyme complex designated DICER COMPLEX, `dices` the VGAM325 folded precursor RNA into VGAM325 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM325 RNA is designated SEQ ID:660, and is provided hereinbelow with reference to the sequence listing part.

[9595] VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM325 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM325 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9596] VGAM325 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM325 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM325 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9597] The complementary binding of VGAM325 RNA, herein designated VGAM RNA, to host target binding sites on VGAM325 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM325 host target RNA into VGAM325 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9598] It is appreciated that VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM325 host target genes. The mRNA of each one of this plurality of VGAM325 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM325 RNA, herein designated VGAM RNA, and which when bound by VGAM325 RNA causes inhibition of translation of respective one or more VGAM325 host target proteins.

[9599] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM325 gene, herein designated VGAM GENE, on one or more VGAM325 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9600] It is yet further appreciated that a function of VGAM325 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM325 correlate with, and may be deduced from, the identity of the host

target genes which VGAM325 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9601] Nucleotide sequences of the VGAM325 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM325 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM325 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM325 are further described hereinbelow with reference to Table 1.

[9602] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM325 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM325 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9603] As mentioned hereinabove with reference to Fig. 1, a function of VGAM325 gene, herein designated VGAM is inhibition of expression of VGAM325 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM325 correlate with, and may be deduced from, the identity of the target genes which VGAM325

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9604] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM325 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9605] A function of VGAM325 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM325 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9606] Another function of VGAM325 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM325 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also

designated SEQ ID:660.

[9607] Another function of VGAM325 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. KIAA0475 (Accession NM_014864) is another VGAM325 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9608] Another function of VGAM325 is therefore inhibition of KIAA0475 (Accession NM_014864). Accordingly, utilities

of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM325 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9609] Another function of VGAM325 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM325 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9610] Another function of VGAM325 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM325 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM325 RNA, herein designated VGAM RNA, also designated SEQ ID:660.

[9611] Another function of VGAM325 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM325 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 326 (VGAM326) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9612] VGAM326 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM326 was detected is described hereinabove with reference to Figs. 1–8.

[9613] VGAM326 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9614] VGAM326 gene encodes a VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM326 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM326 precursor RNA is designated SEQ ID:312, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:312 is located at position 188927 relative to the genome of Vac–

cinia Virus.

[9615] VGAM326 precursor RNA folds onto itself, forming VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9616] An enzyme complex designated DICER COMPLEX, `dices` the VGAM326 folded precursor RNA into VGAM326 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM326 RNA is designated SEQ ID:661, and is provided hereinbelow with reference to the sequence listing part.

[9617] VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM326 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9618] VGAM326 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM326 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM326 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9619] The complementary binding of VGAM326 RNA, herein designated VGAM RNA, to host target binding sites on VGAM326 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM326 host target RNA into VGAM326 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9620] It is appreciated that VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM326 host target genes. The mRNA of each one of this plurality of VGAM326 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM326 RNA, herein designated VGAM RNA, and which when bound by VGAM326 RNA causes inhibition of translation of respective one or more VGAM326 host target proteins.

[9621] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM326 gene, herein designated VGAM GENE, on one or more VGAM326 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9622] It is yet further appreciated that a function of VGAM326 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific functions, and accordingly utilities, of VGAM326 correlate

with, and may be deduced from, the identity of the host target genes which VGAM326 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9623] Nucleotide sequences of the VGAM326 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM326 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM326 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM326 are further described hereinbelow with reference to Table 1.

[9624] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM326 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM326 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9625] As mentioned hereinabove with reference to Fig. 1, a function of VGAM326 gene, herein designated VGAM is inhibition of expression of VGAM326 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM326 correlate with, and may be deduced

from, the identity of the target genes which VGAM326 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9626] Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748) is a VGAM326 host target gene. CAPN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN2 BINDING SITE, designated SEQ ID:855, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9627] A function of VGAM326 is therefore inhibition of Calpain 2, (m/II) Large Subunit (CAPN2, Accession NM_001748). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN2. Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434) is another VGAM326 host target gene. DAAM2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DAAM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DAAM2 BINDING SITE, designated SEQ ID:3559, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9628] Another function of VGAM326 is therefore inhibition of Dishevelled Associated Activator of Morphogenesis 2 (DAAM2, Accession XM_166434), a gene which controls cell polarity and movement during development. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DAAM2. The function of DAAM2 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15. Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450) is another VGAM326 host target gene. SELE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELE BINDING SITE, designated SEQ ID:747, to the nucleotide sequence

of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9629] Another function of VGAM326 is therefore inhibition of Selectin E (endothelial adhesion molecule 1) (SELE, Accession NM_000450), a gene which expressed on cytokine induced endothelial cells and mediates their binding to leukocytes. Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELE. The function of SELE and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM15.KIAA0475 (Accession NM_014864) is another VGAM326 host target gene. KIAA0475 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0475 BINDING SITE, designated SEQ ID:1570, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9630] Another function of VGAM326 is therefore inhibition of

KIAA0475 (Accession NM_014864). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0475. LOC222671 (Accession XM_167094) is another VGAM326 host target gene. LOC222671 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222671 BINDING SITE, designated SEQ ID:3582, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9631] Another function of VGAM326 is therefore inhibition of LOC222671 (Accession XM_167094). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222671. LOC254901 (Accession XM_171878) is another VGAM326 host target gene. LOC254901 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254901, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254901 BINDING SITE, designated SEQ ID:3699, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9632] Another function of VGAM326 is therefore inhibition of LOC254901 (Accession XM_171878). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254901. LOC257615 (Accession XM_175293) is another VGAM326 host target gene. LOC257615 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257615 BINDING SITE, designated SEQ ID:3749, to the nucleotide sequence of VGAM326 RNA, herein designated VGAM RNA, also designated SEQ ID:661.

[9633] Another function of VGAM326 is therefore inhibition of LOC257615 (Accession XM_175293). Accordingly, utilities of VGAM326 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257615. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 327 (VGAM327) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9634] VGAM327 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM327 was detected is described hereinabove with reference to Figs. 1–8.

[9635] VGAM327 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Vaccinia Virus.

VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9636] VGAM327 gene encodes a VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM327 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM327 precursor RNA is designated SEQ ID:313, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:313 is

located at position 188927 relative to the genome of Vac-
cinia Virus.

[9637] VGAM327 precursor RNA folds onto itself, forming VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9638] An enzyme complex designated DICER COMPLEX, `dices` the VGAM327 folded precursor RNA into VGAM327 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 84%) nucleotide sequence of VGAM327 RNA is designated SEQ ID:662, and is provided hereinbelow with reference to the sequence listing part.

[9639] VGAM327 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM327 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9640] VGAM327 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM327 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM327 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM327 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9641] The complementary binding of VGAM327 RNA, herein designated VGAM RNA, to host target binding sites on VGAM327 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM327 host target RNA into VGAM327 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9642] It is appreciated that VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM327 host target genes. The mRNA of each one of this plurality of VGAM327 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM327 RNA, herein designated VGAM RNA, and which when bound by VGAM327 RNA causes inhibition of translation of respective one or more VGAM327

host target proteins.

[9643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM327 gene, herein designated VGAM GENE, on one or more VGAM327 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9644] It is yet further appreciated that a function of VGAM327 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM327 include diagnosis, prevention and treatment of viral infection by Vaccinia Virus. Specific

functions, and accordingly utilities, of VGAM327 correlate with, and may be deduced from, the identity of the host target genes which VGAM327 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9645] Nucleotide sequences of the VGAM327 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM327 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM327 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM327 are further described hereinbelow with reference to Table 1.
- [9646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM327 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM327 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
